Hurricane Science Tutorial

Kerry Emanuel
Lorenz Center, MIT

Why Should You Care?

- **Forecasting**
  - Much progress in social science of response to warnings, requests to evacuate, etc.
- **Forecasters are ambassadors to meteorology**
  - Opportunity to inform public
  - Knowledge of hurricane science increases public interest and trust

Program

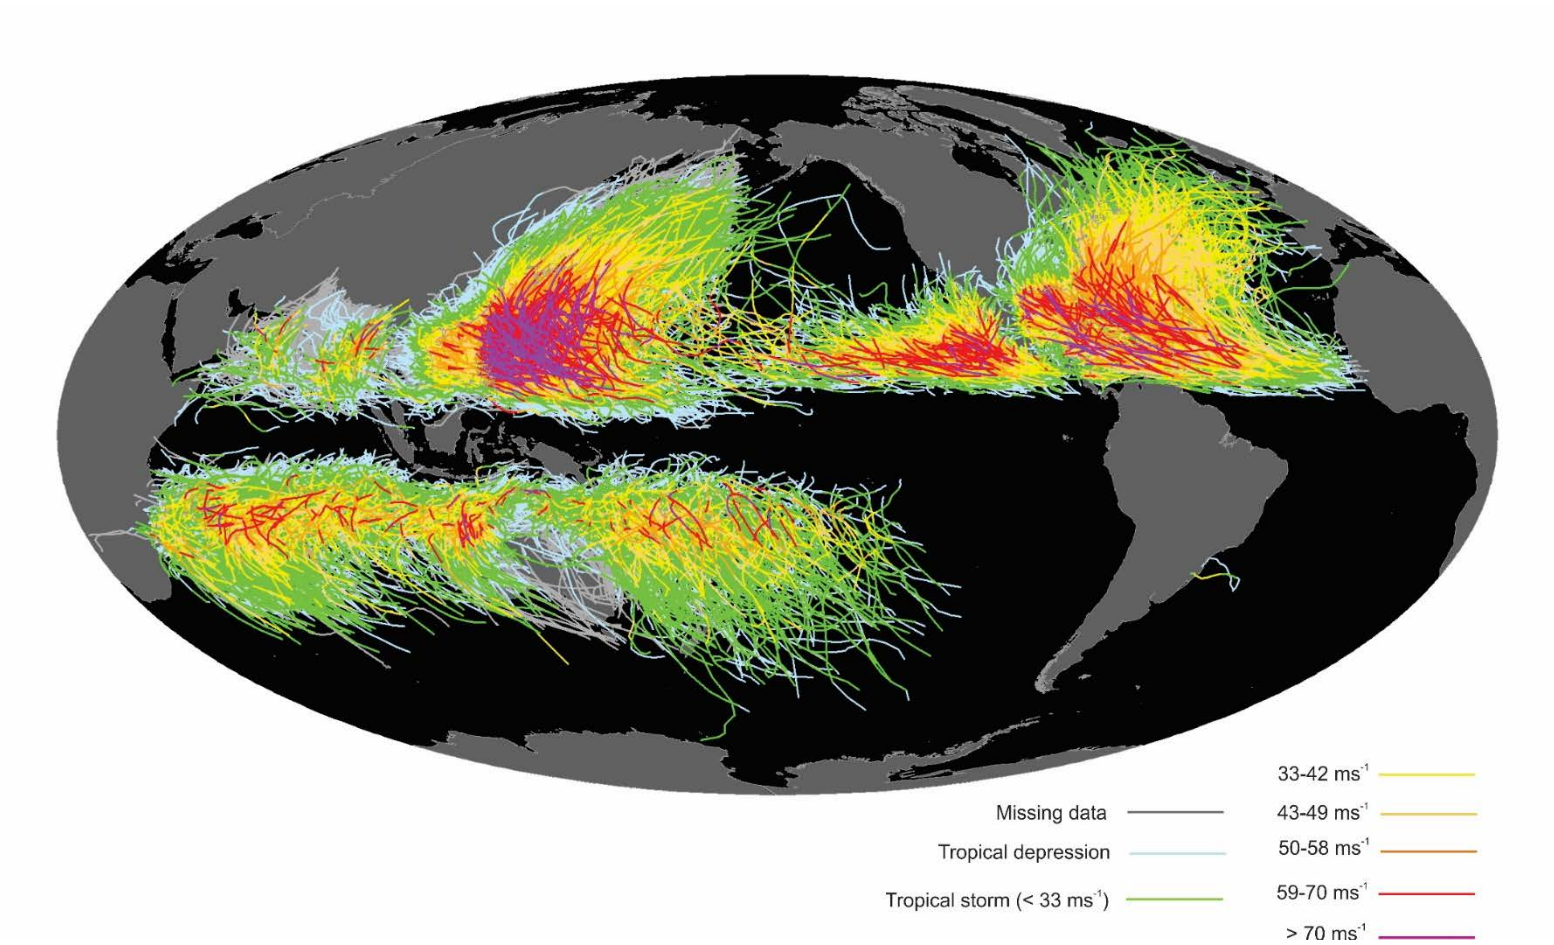
- Brief overview of hurricanes
- Current understanding
  - Energy cycle of mature hurricanes – concept of potential intensity
  - Negative influences on hurricanes
  - Statistics of hurricane intensification
  - Hurricane motion
  - Hurricanes and climate change
- Summary

Overview: What is a Hurricane?

Formal definition: A *tropical cyclone* with 1-min average winds at 10 m altitude in excess of 32 m/s (64 knots or 74 MPH) occurring over the North Atlantic or eastern North Pacific

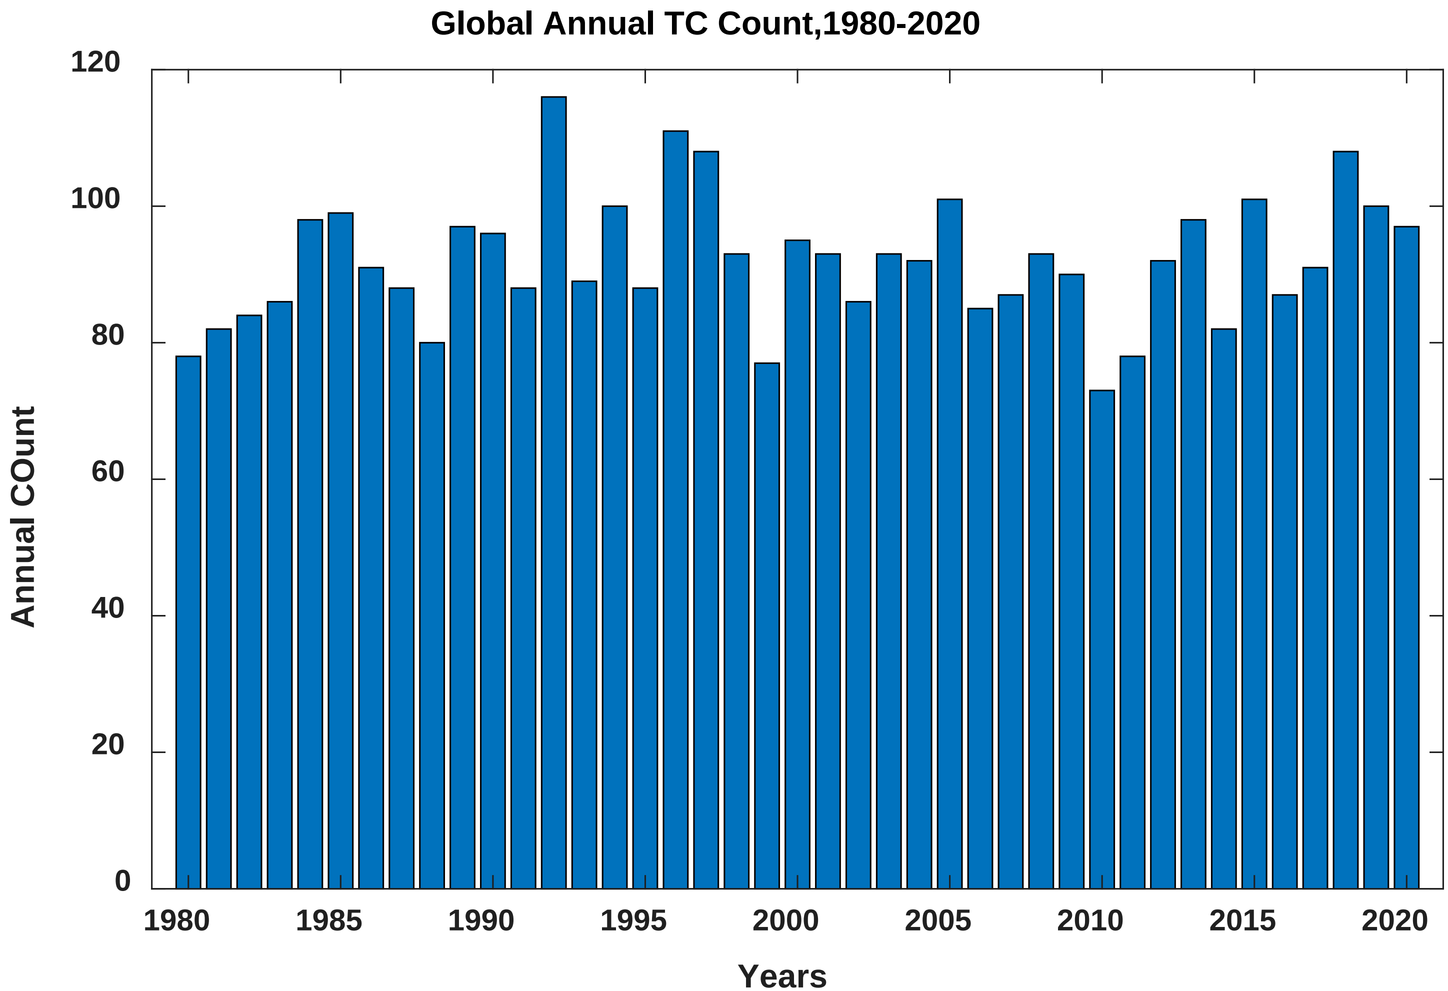
A *tropical cyclone* is a nearly symmetric, warm-core cyclone powered by wind-induced enthalpy fluxes from the sea surface

Global Climatology



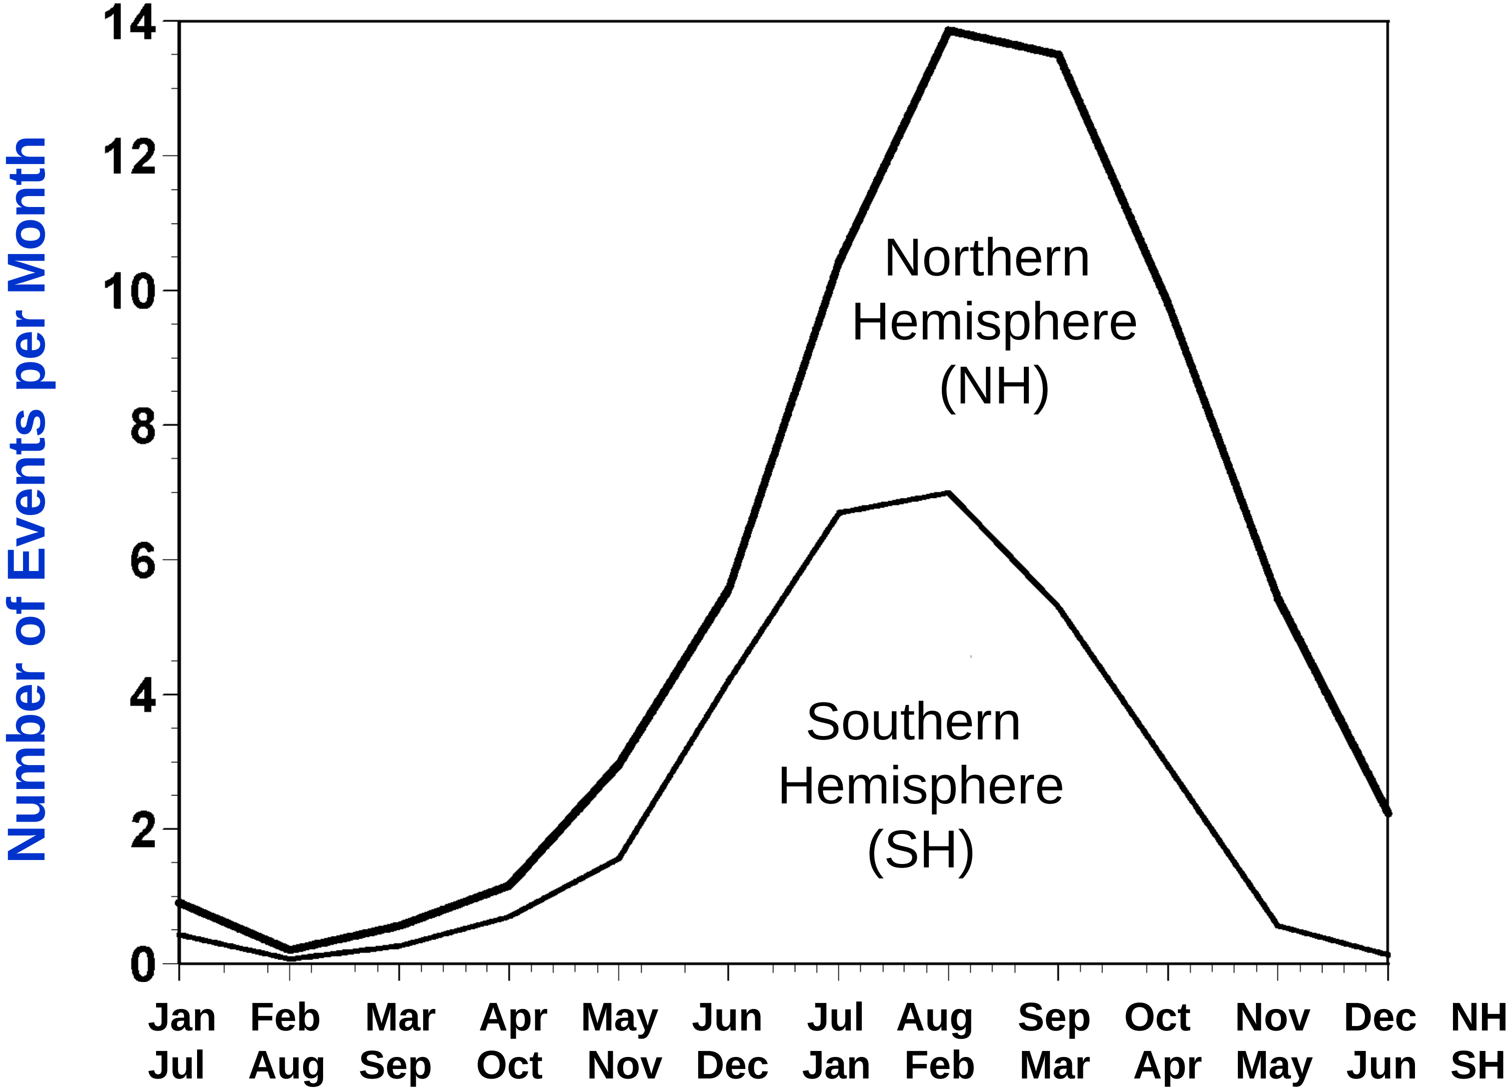
Tracks of all tropical cyclones in the historical record from 1851 to 2010. The tracks are colored according to the maximum wind at 10 m altitude, on the scale at lower right.

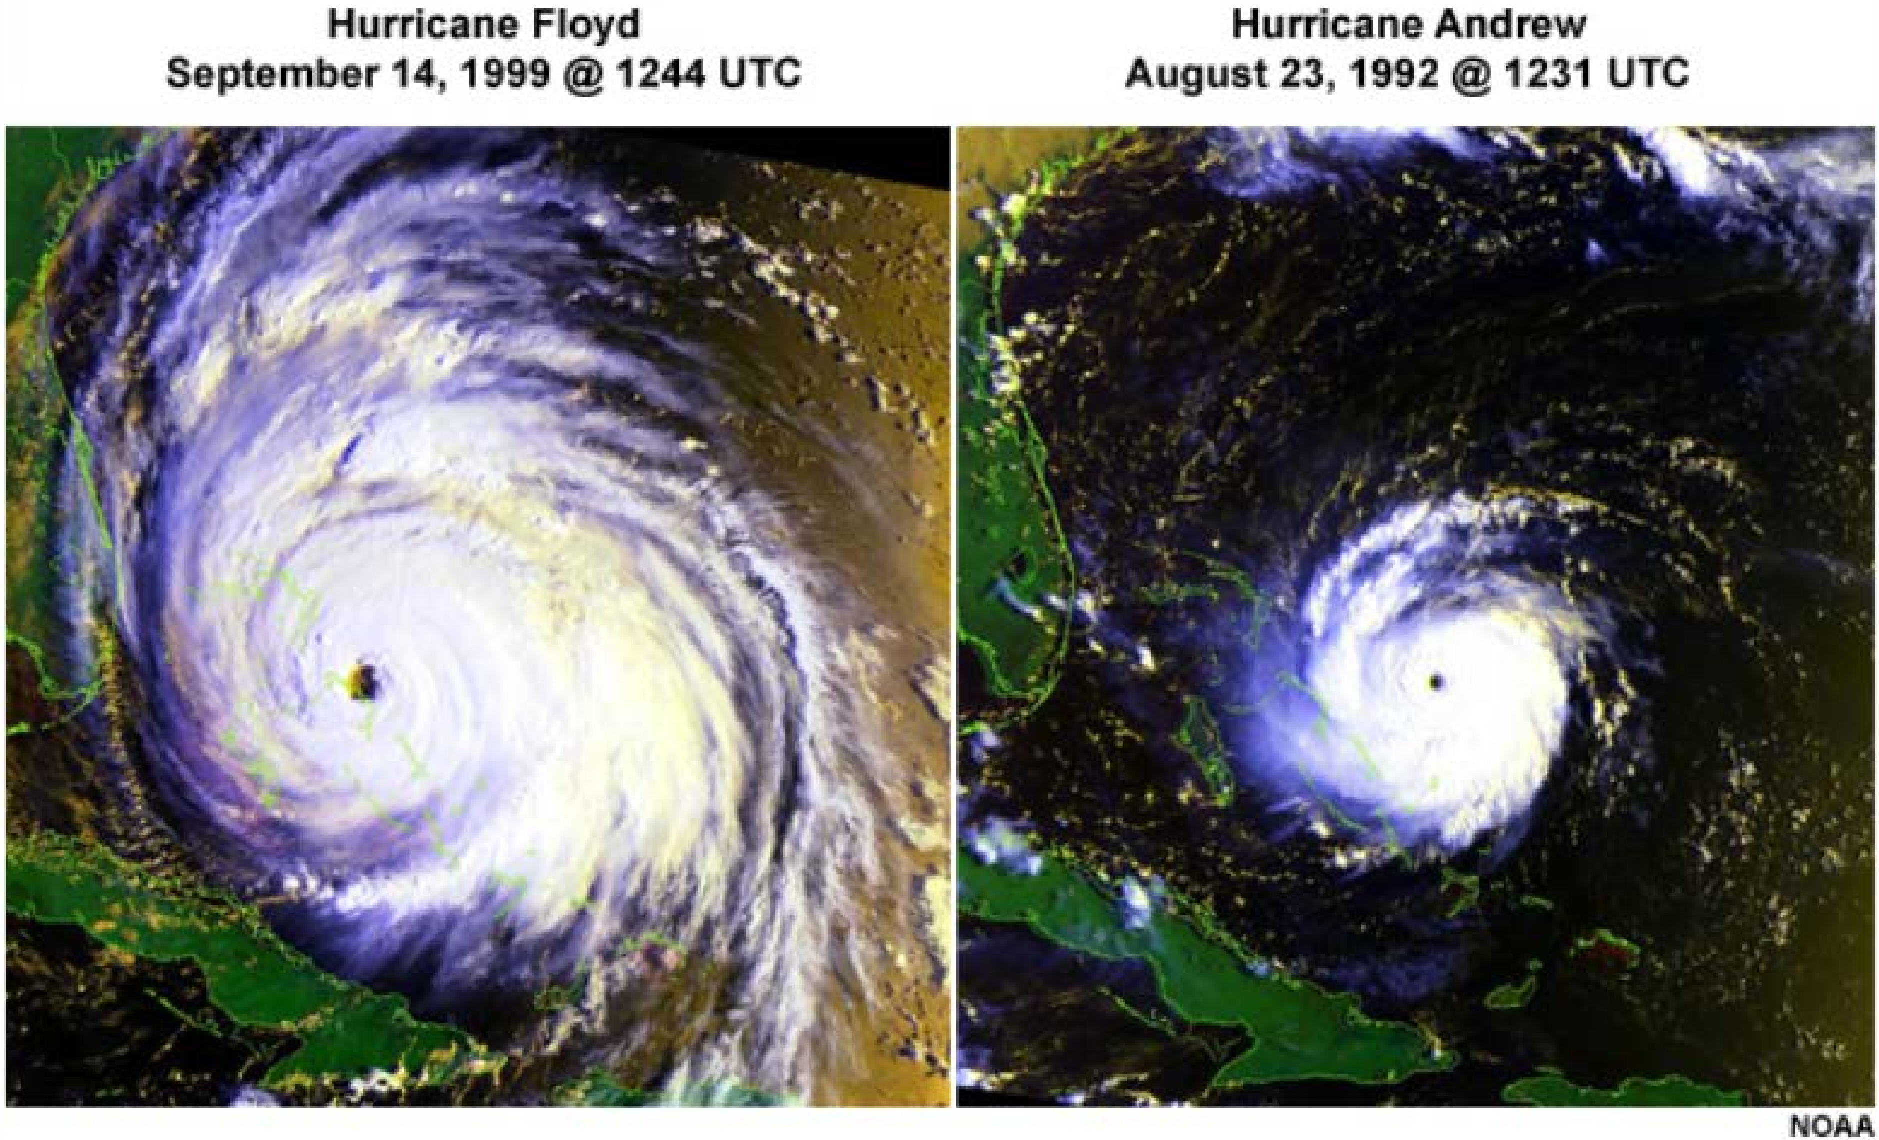
Global Tropical Cyclone Frequency, 1980-2020



Data Sources: NOAA/TPC and NAVY/JTWC

Annual Cycle of Tropical Cyclones





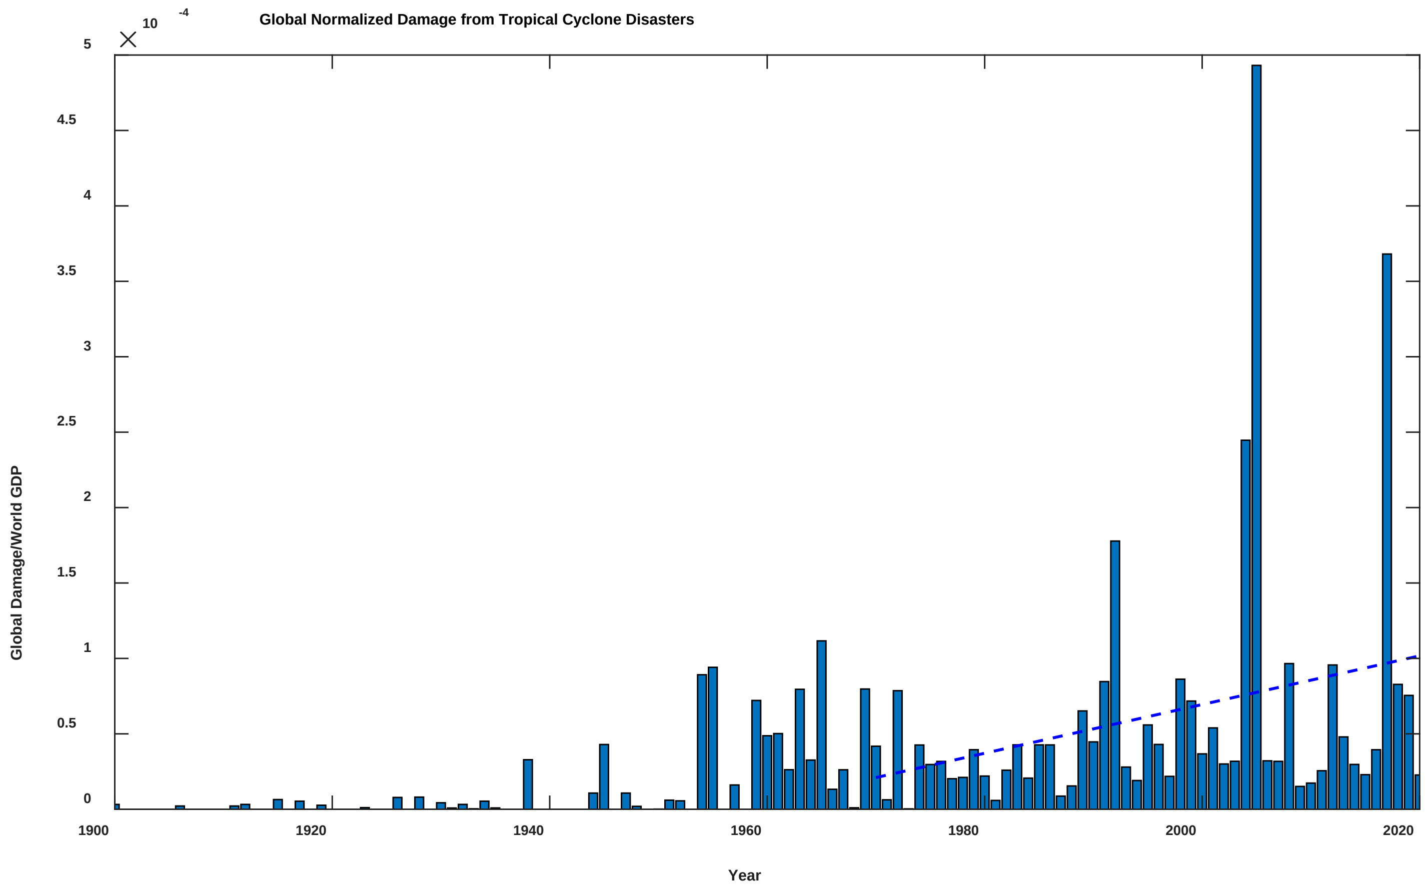
The spiral rainbands of Hurricane Floyd (left, 1999) versus the more compact Hurricane Andrew (right, 1992)

The Global Hurricane Hazard

- About 15,000 deaths per year since 1971
- $ 1.1 trillion 2015 U.S. dollars in damages ($21 billion/yr) since 1971
- Global population exposed to hurricane hazards has tripled since 1970

EM-DAT, 2020: The OFDA/CRED International Disaster Database http://www.emdat.be/.

Global Tropical Cyclone Damage Normalized by Gross World Product



- 380% increase since 1970
- Population of TC-prone regions increased by ~200%
- Suggests that climate change has contributed to increasing damage

EM-DAT, 2020: The OFDA/CRED International Disaster Database http://www.emdat.be/.

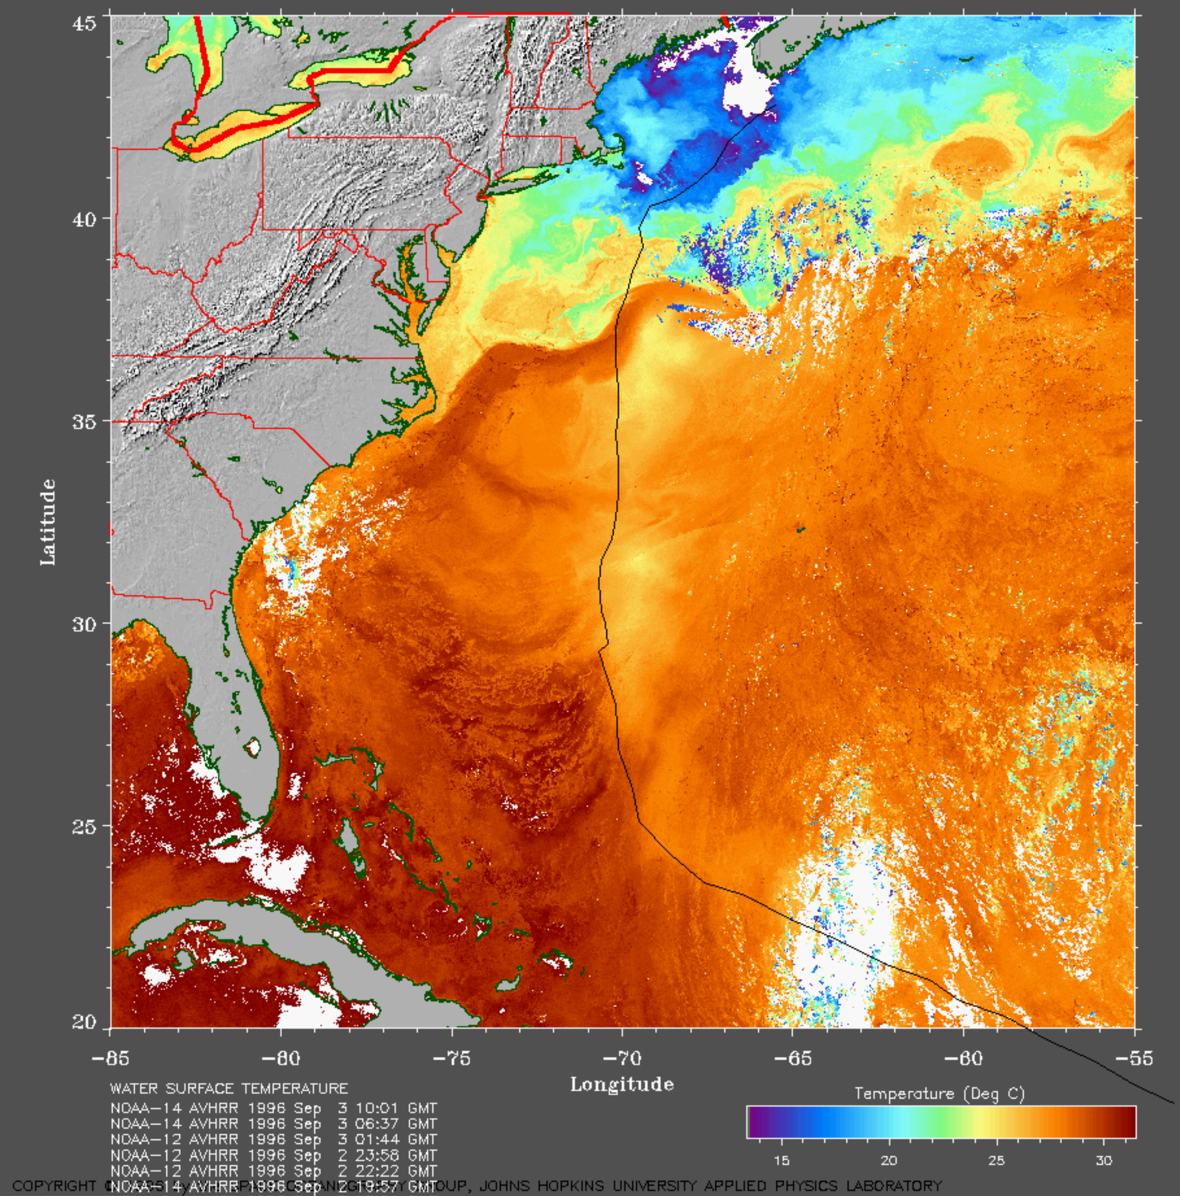
Why do real storms seldom reach their thermodynamic potential?

One Reason: Ocean Interaction

Strong Mixing of Upper Ocean



Comparing Fixed to Interactive SST:

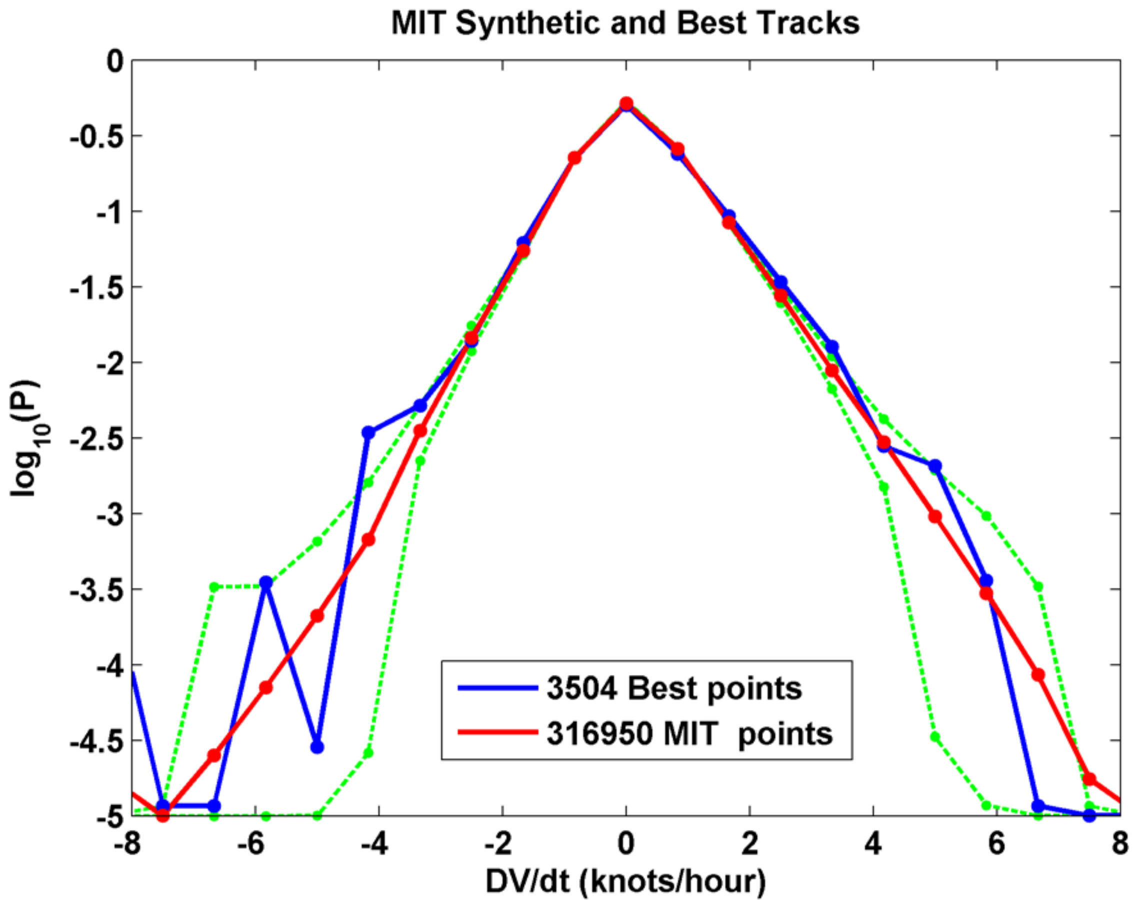
Shear appears to weaken TCs by blowing dry, low theta_e air into the core

Statistics of Hurricane Intensification



Common logarithms of the probability densities of open-ocean tropical cyclone intensity change rates in the North Atlantic region from 3504 observations (blue) and from 316 950 synthetic samples (red) of hurricane-intensity storms. Green lines or dots indicate the 5th and 95th percentiles of 1000 subsamples of the synthetic tracks data at the rate of the observed data for each intensity change bin. All distributions are bounded below by 1025. The synthetic data are subsampled every 6 h and rounded to 5 kt to match the best track data

Tropical Cyclone Motion

Tropical cyclones move approximately with a suitably defined vertical vector average of the flow in which they are embedded

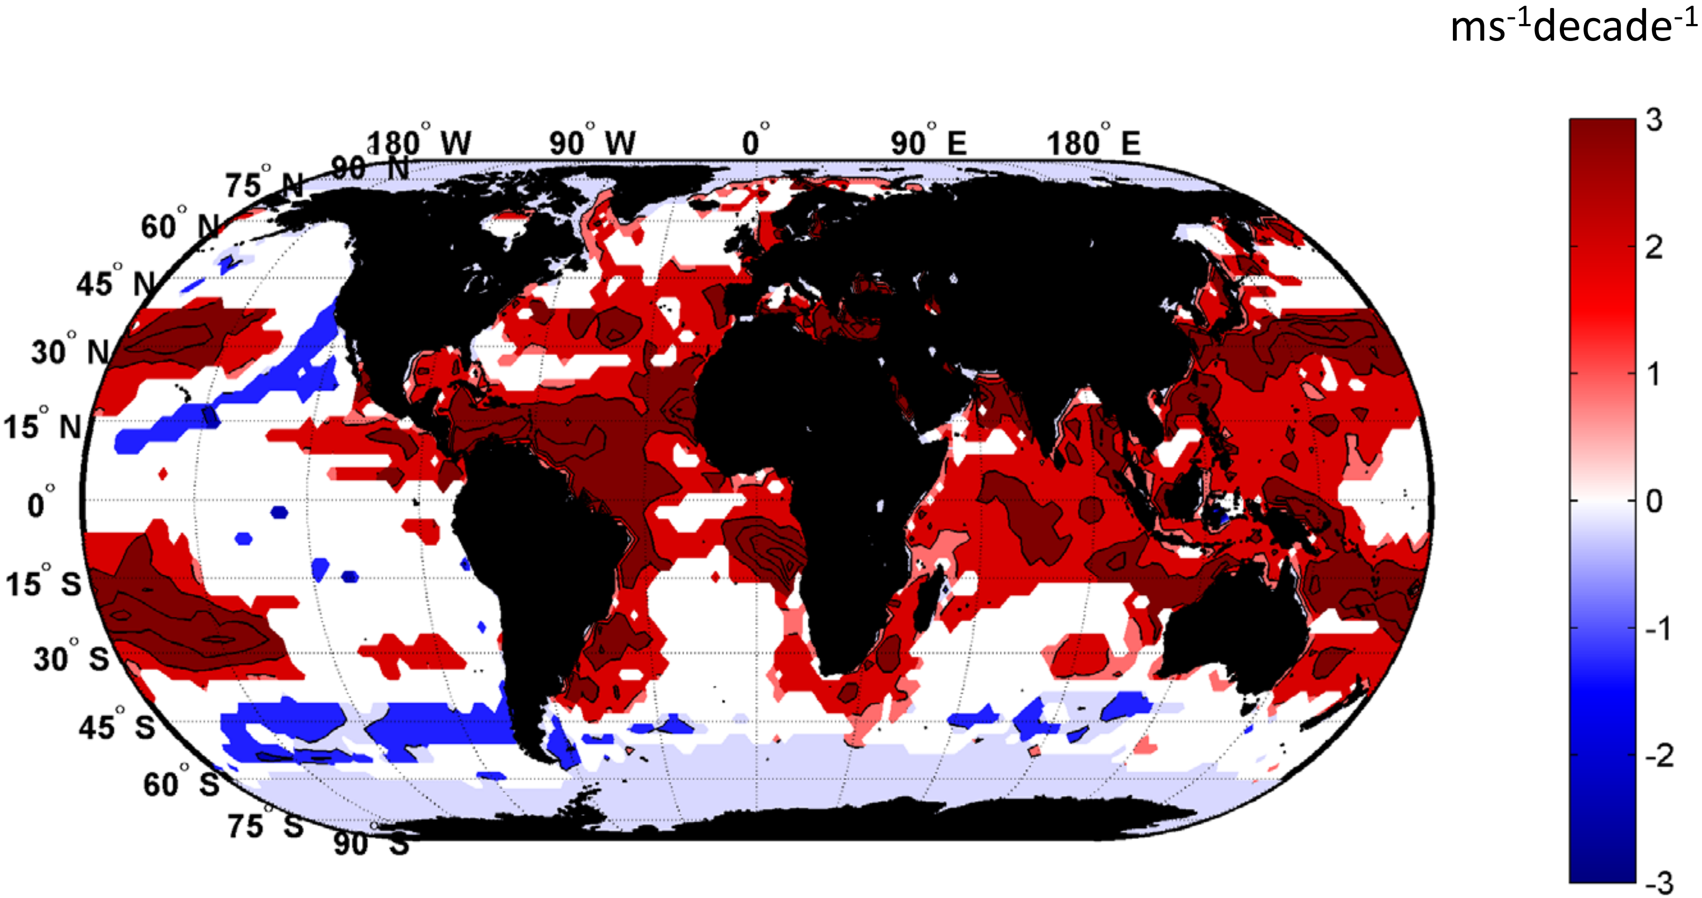
Hurricanes and Climate

Trends in Thermodynamic Potential for Hurricanes, 1980-2010
(NCAR/NCEP Reanalysis)



Inferences from Basic Theory:

- Potential intensity increases with global warming
- Incidence of high-intensity hurricanes should increase
- Increases in potential intensity should be faster in sub-tropics
- Hurricanes will produce substantially more rain: Clausius-Clapeyron yields ~7% increase in water vapor per 1^{o}C warming

Summary

- Hurricanes are almost perfect Carnot heat engines, operating off the thermodynamic disequilibrium between the tropical ocean and atmosphere, made possible by the greenhouse effect

- **Most hurricanes are prevented from reaching their potential intensity by storm-induced ocean cooling and environmental wind shear**

- **Hurricanes move with some vertical average of the environmental flow plus effects due to the earth's rotation and curvature, and to wind shear**

- **Hurricanes are expected to become more intense and rain more as the climate warms**
