The Danger of Storm Surge

2,544 Fatalities From 1963–2012

- Almost 50 % the deaths are due to storm surge
- Over 80 % of deaths are due to water
- Wind causes less than 10 % of deaths

STORM SURGE IMPACTS

Waveland, Mississippi

Kimberly and David King

MYTH OR FACT?

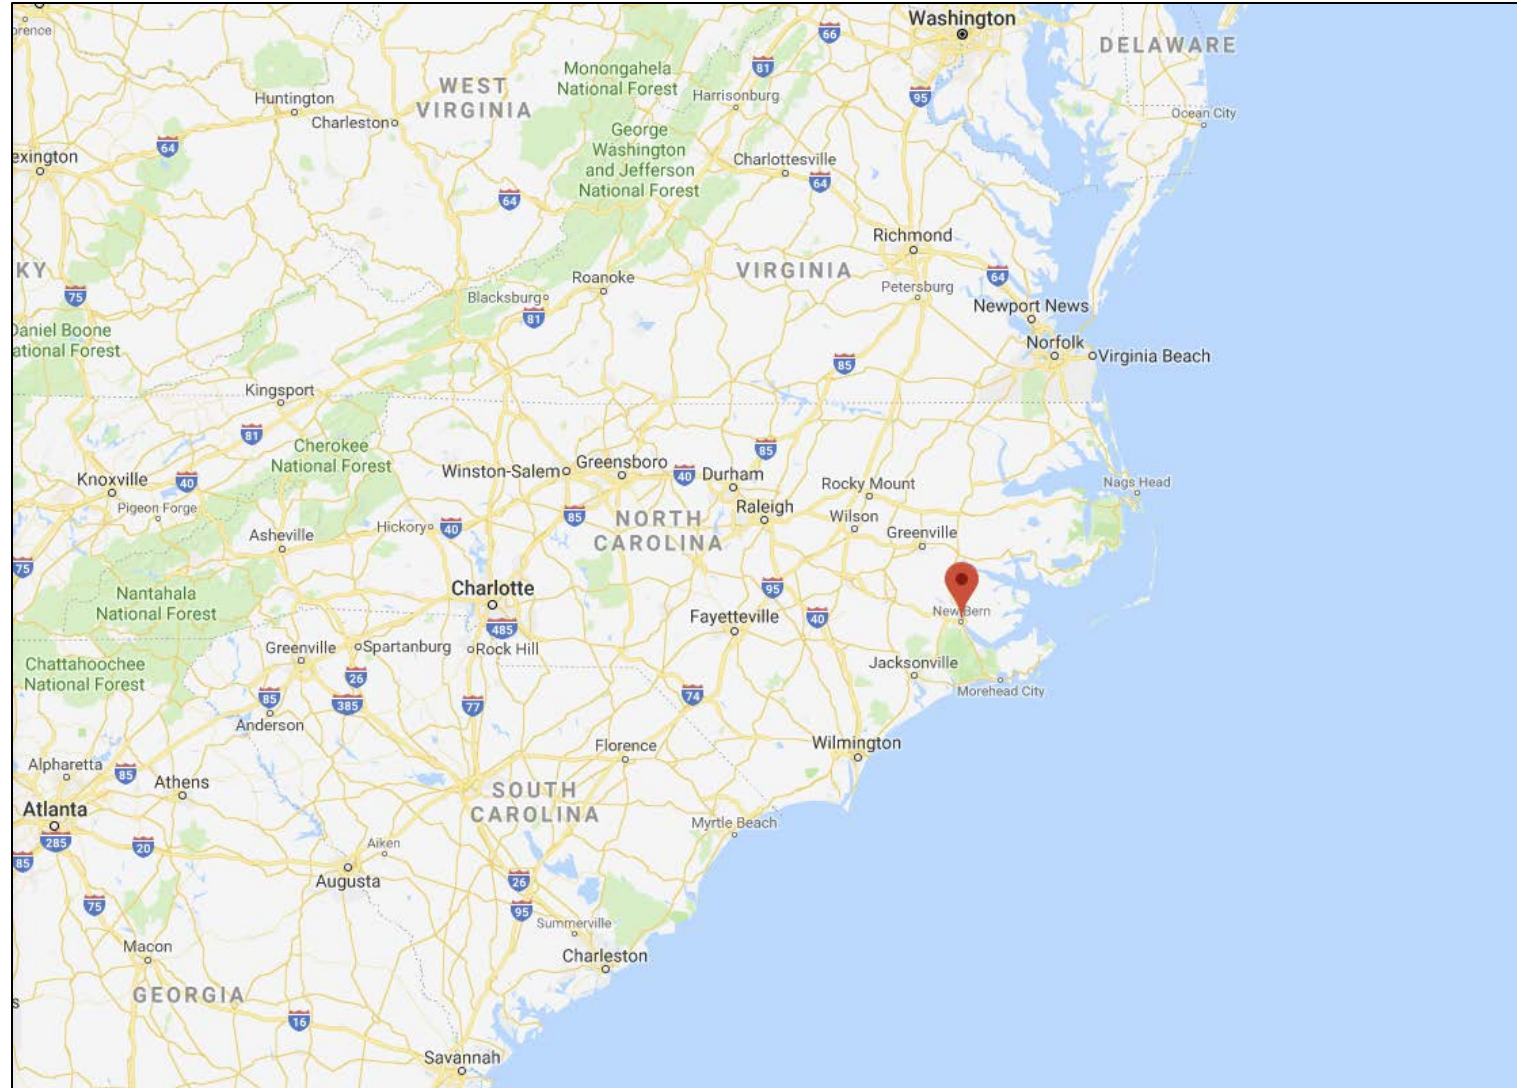

Inland

I live miles from the beach, so storm surge is not my problem.

Myth

New Bern, NC – Hurricane Florence

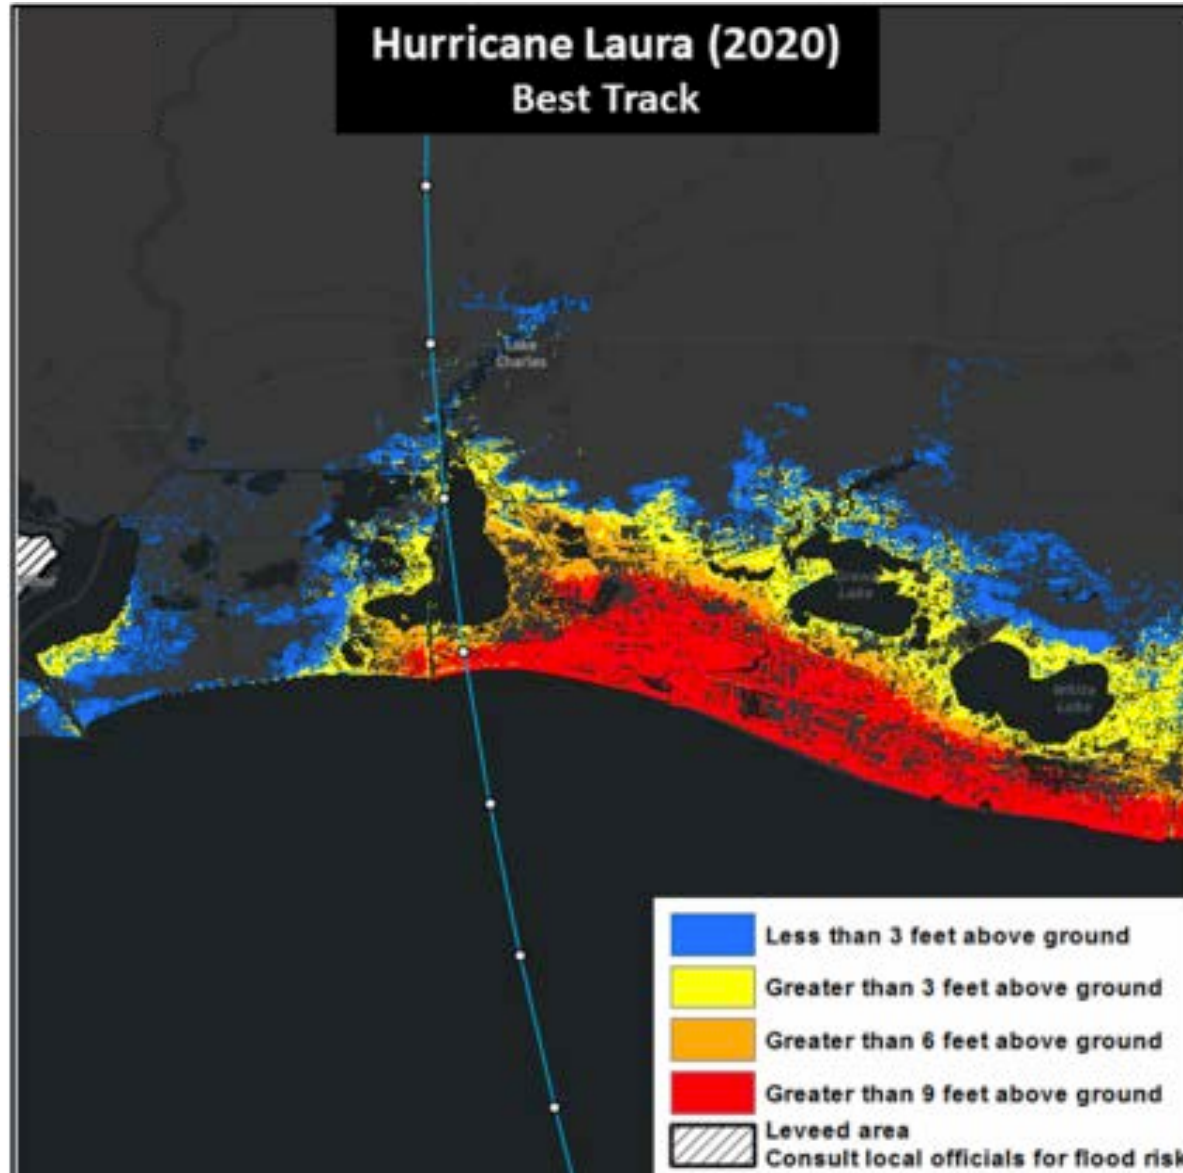

New Bern, NC – Hurricane Florence

New Bern, NC – Hurricane Florence

Hurricane Laura Inundation Depth

MYTH OR FACT?

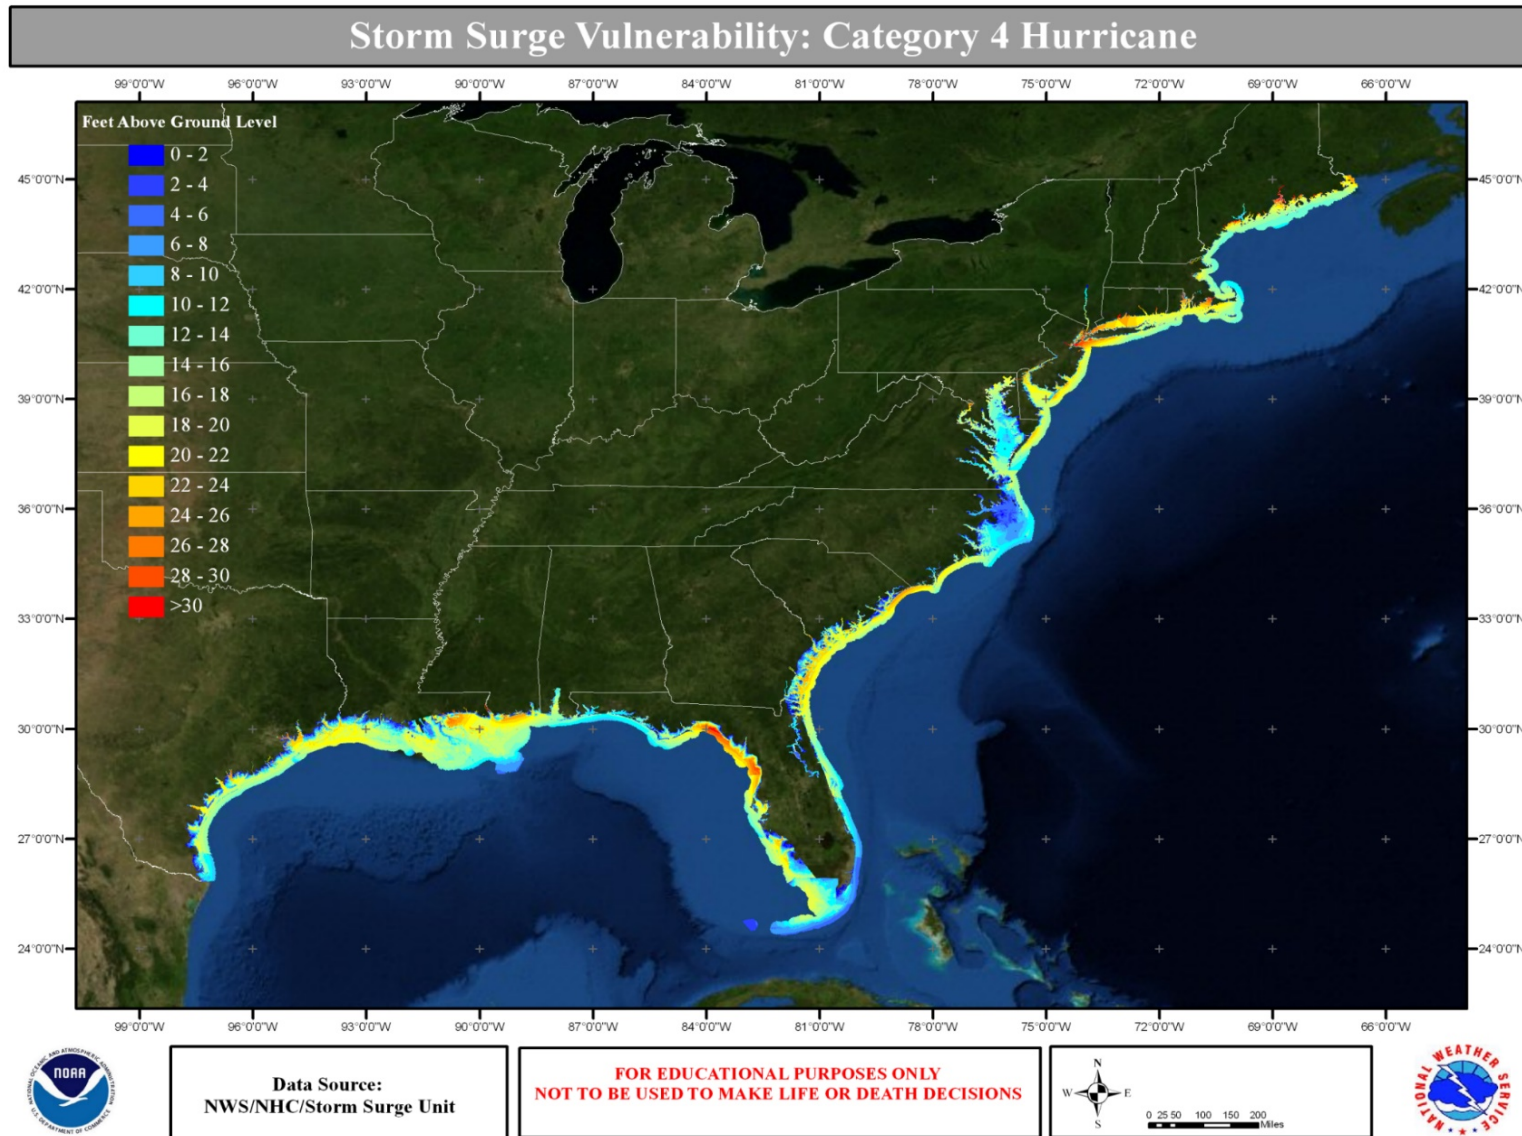

Vulnerability

Are some areas more vulnerable to storm surge than others?

Fact

Storm Surge Vulnerability Example

STORM SURGE

Where does storm surge occur?

What exactly is storm surge and how does it work?

Deep Water

STORM SURGE

Storm Surge vs Storm Tide

STORM SURGE

An abnormal rise of water generated by a storm, over and above the predicted astronomical tide.

STORM TIDE

Water level due to the combination of storm surge and the astronomical tide.

STORM SURGE

Components of 'Total Water Level'

Storm surge + Tides + Wave Setup + Freshwater

What about waves?

- Breaking waves also contribute to the total water level through wave runup/setup
- WAVE RUNUP is the time-varying fluctuation of water-level elevation at the shoreline due to wave breaking
- WAVE SETUP is the time-averaged water level rise due to wave breaking
- The magnitude of both runup and setup are related to offshore wave period, wave height, and shelf slope

Wave Runup and Setup

Freshwater Input

- River input, esp. into bays and sounds
 - Mississippi River discharges 200,000 – 700,000 cubic feet per second
- Rainfall

STORM SURGE

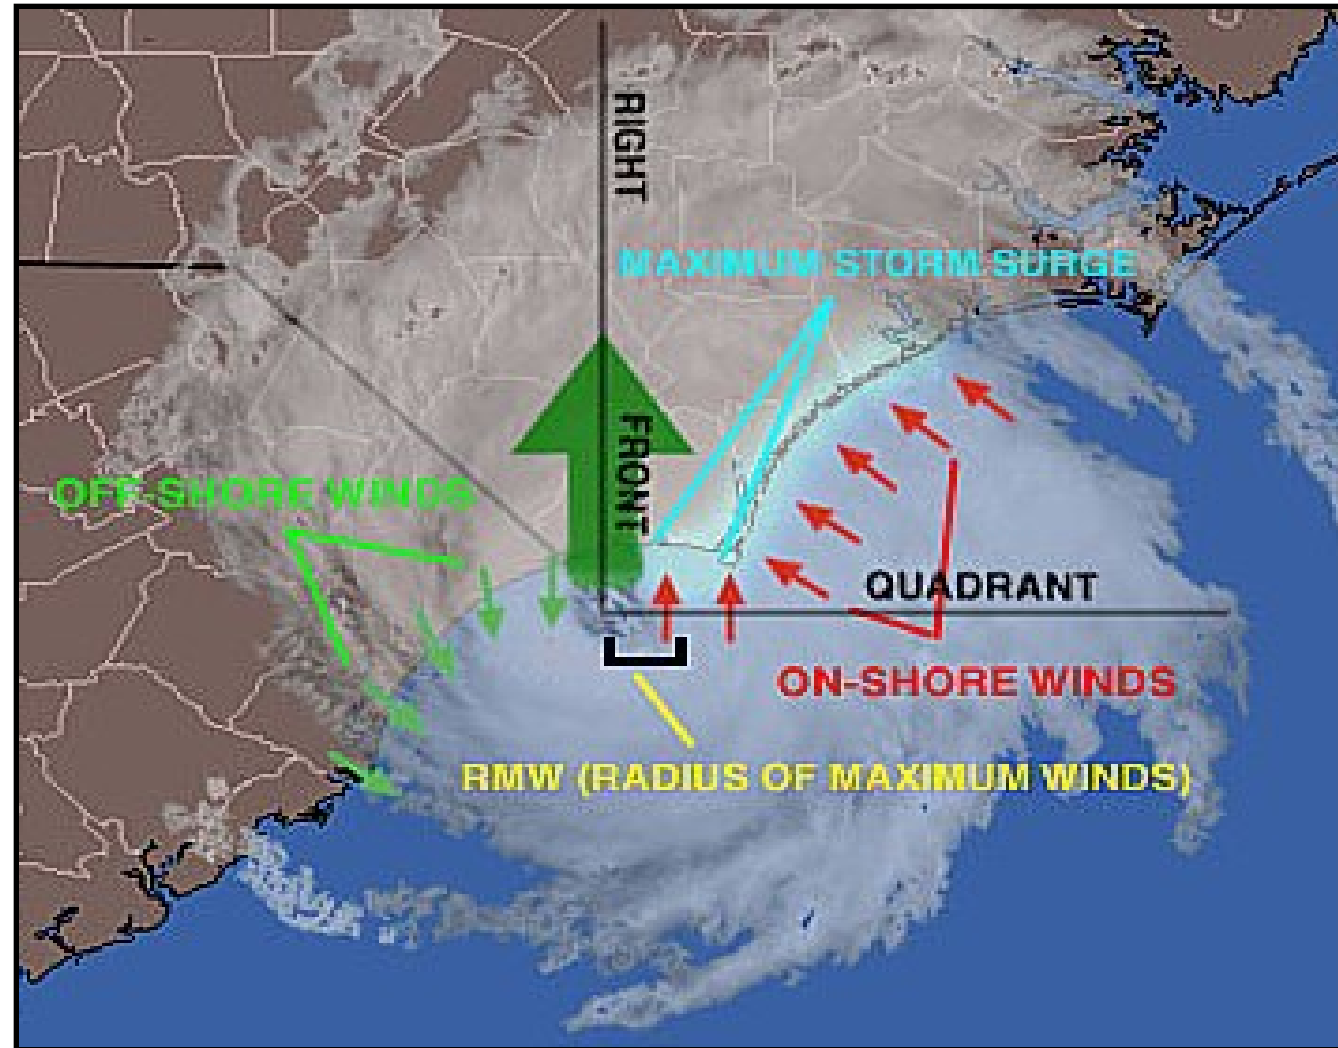

Components of 'Total Water Level'

Storm surge + Tides + Wave Setup + Freshwater

What are the factors that
affect storm surge?

Understanding Surge

Factors Affecting Storm Surge

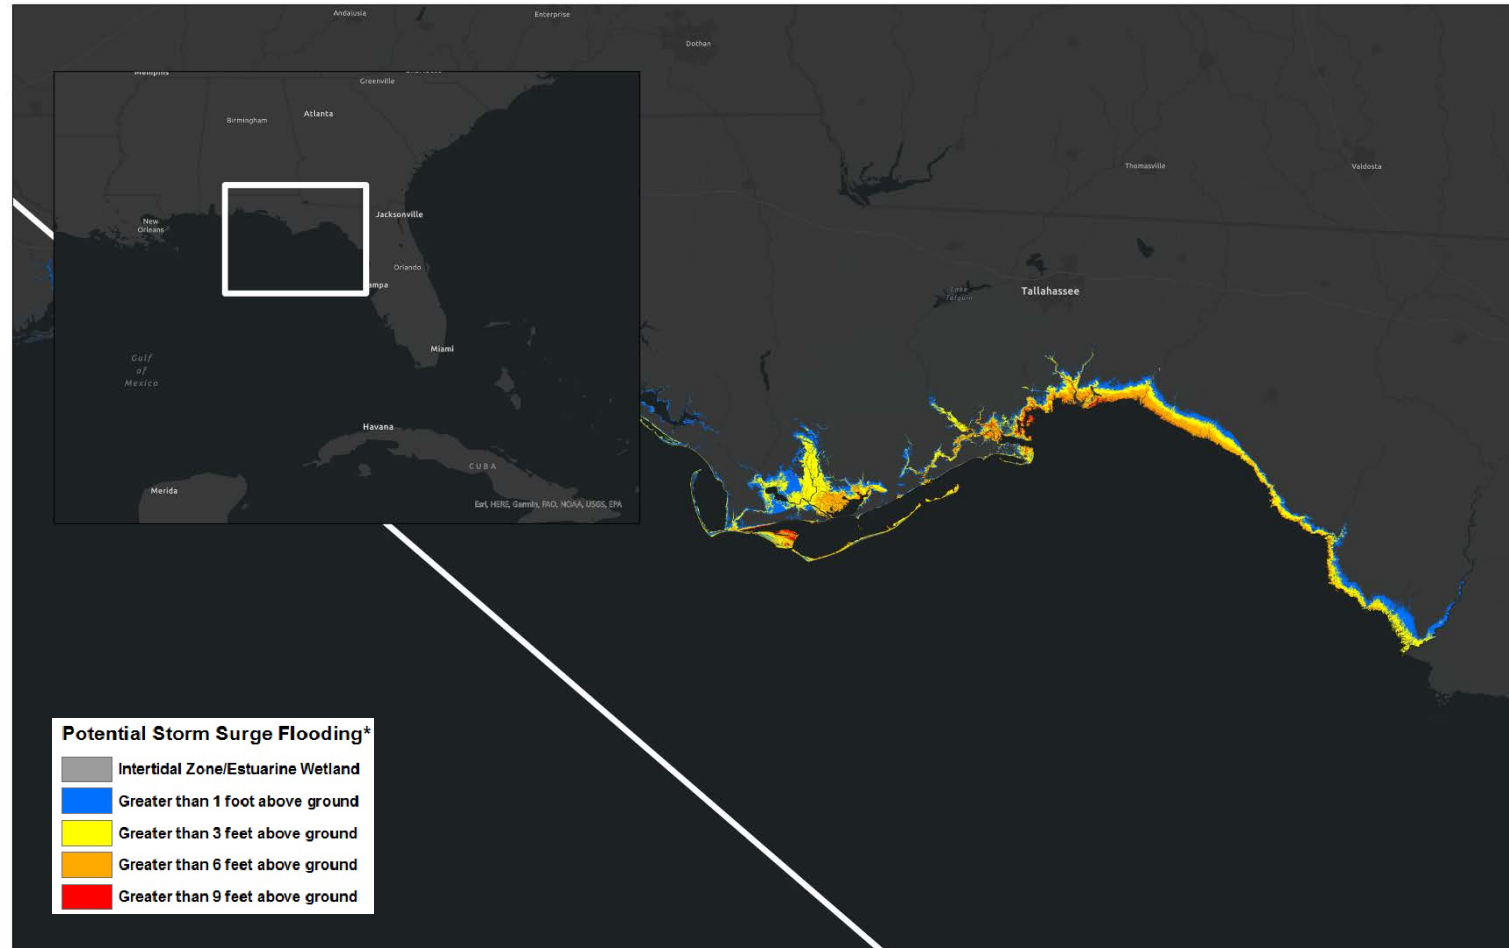

STORM SURGE FACTORS

- **Intensity**
Stronger storm = More storm surge
- **Size (Radius of Maximum Winds)**
Larger = More storm surge
- **Forward Speed**
Slower storm = Storm surge farther inland
- **Angle of Approach**
Alters focus of storm surge
- **Width and Slope of Shelf (Bathymetry)**
Gradual sloping shelf = More storm surge

STORM SURGE FACTORS

What's the effect of intensity? (wind speed)

Category 4

STORM SURGE FACTORS

What's the effect of size?

STORM SURGE FACTORS

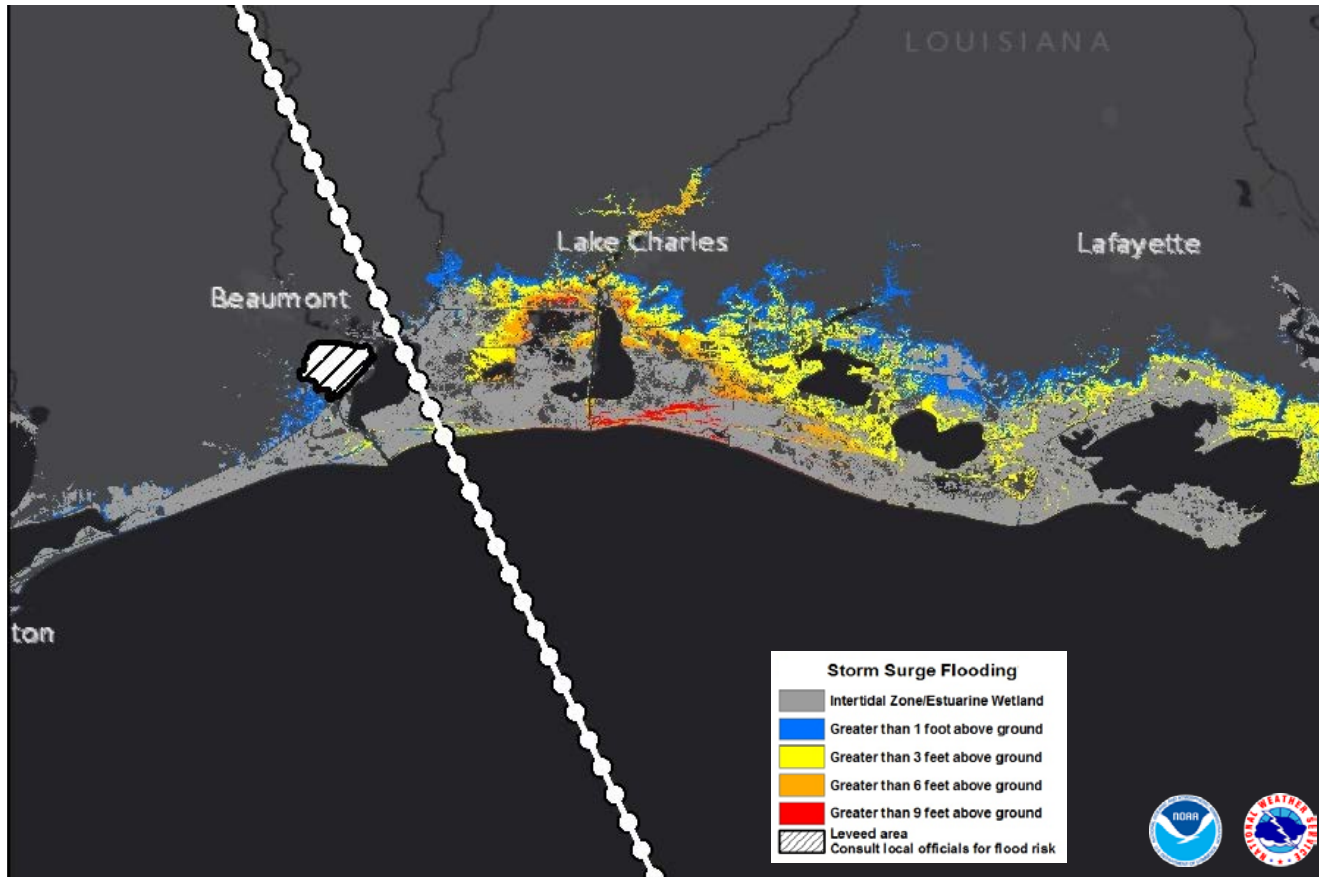

What's the effect of size?

STORM SURGE FACTORS

What's the effect of forward speed?

Forward Speed
25 mph

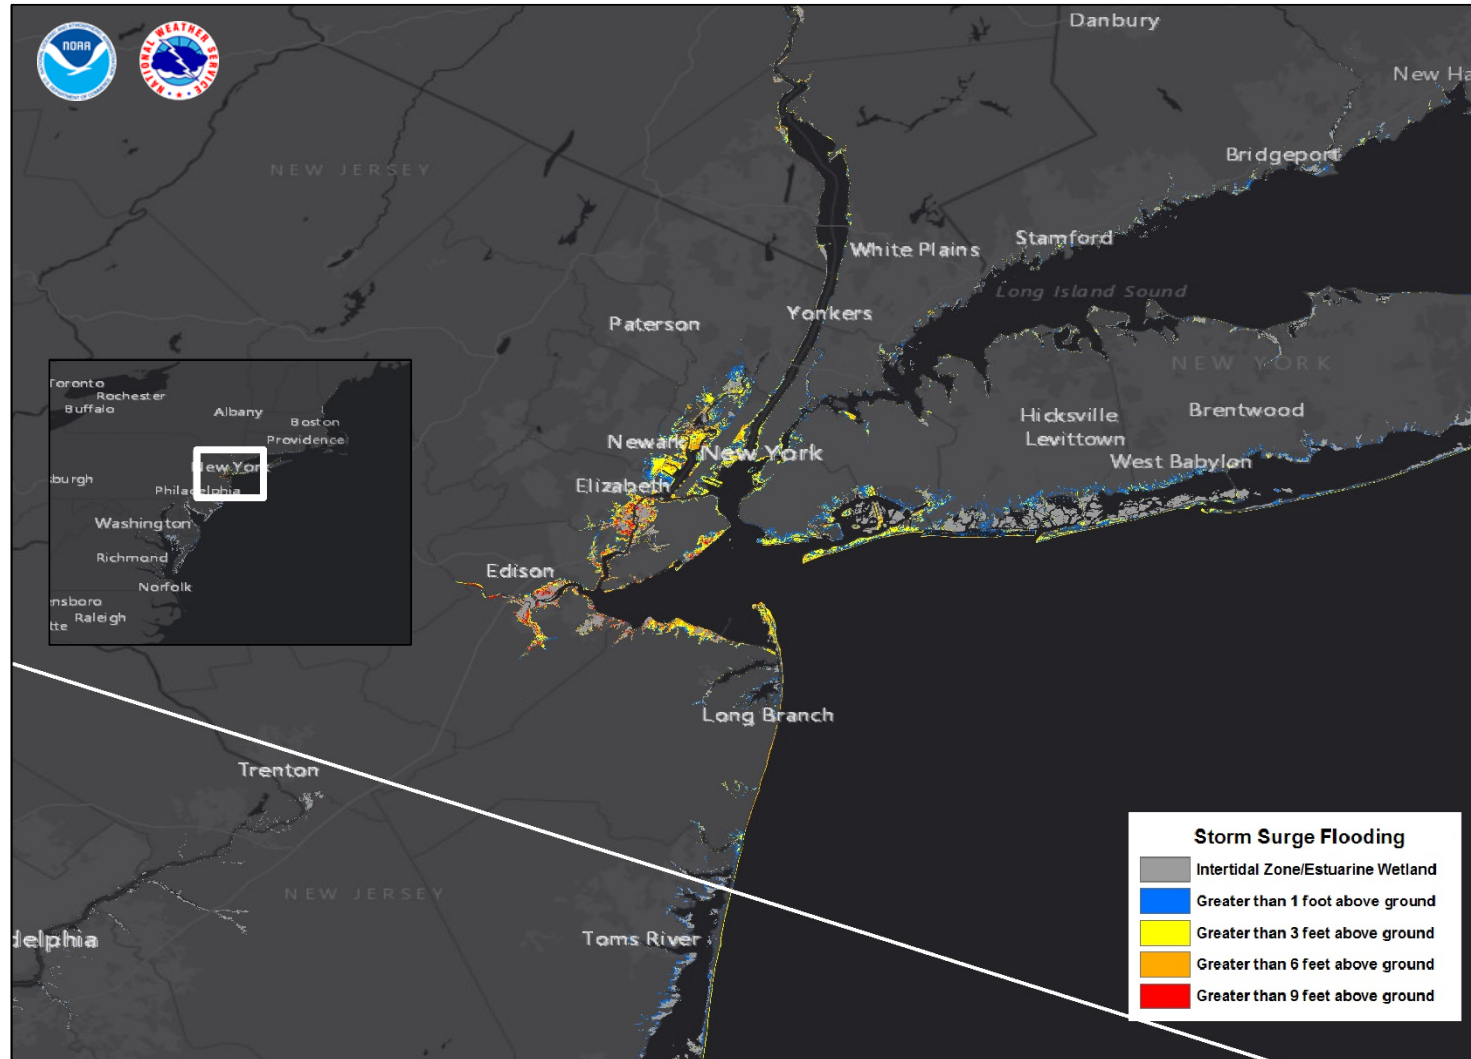

Faster Storms:
Higher maximum at
coast

Slower Storms:
Farther inland
penetration

STORM SURGE FACTORS

What's the effect of angle of approach?

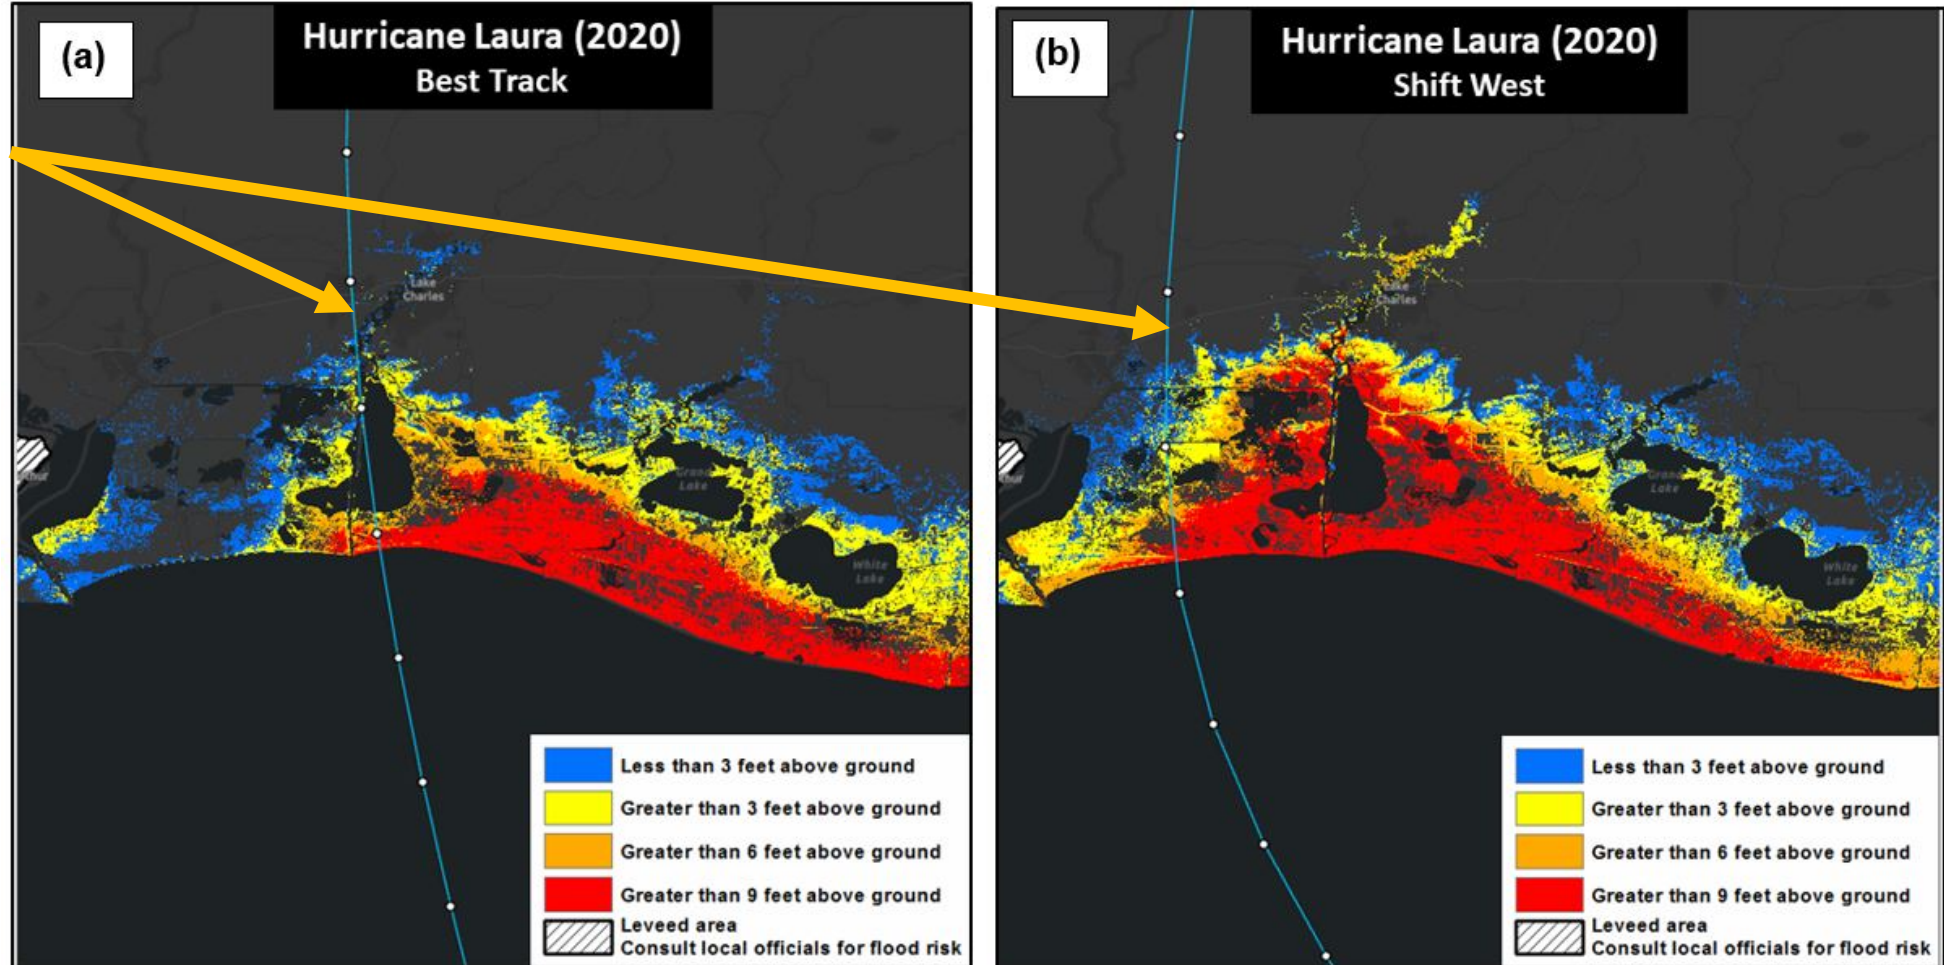

Angle of Approach

NNW

WNW

Factors Affecting Storm Surge

A slight shift in hurricane track can make a dramatic difference in storm surge at a specific location

STORM SURGE

What's the effect of width/slope of shelf?

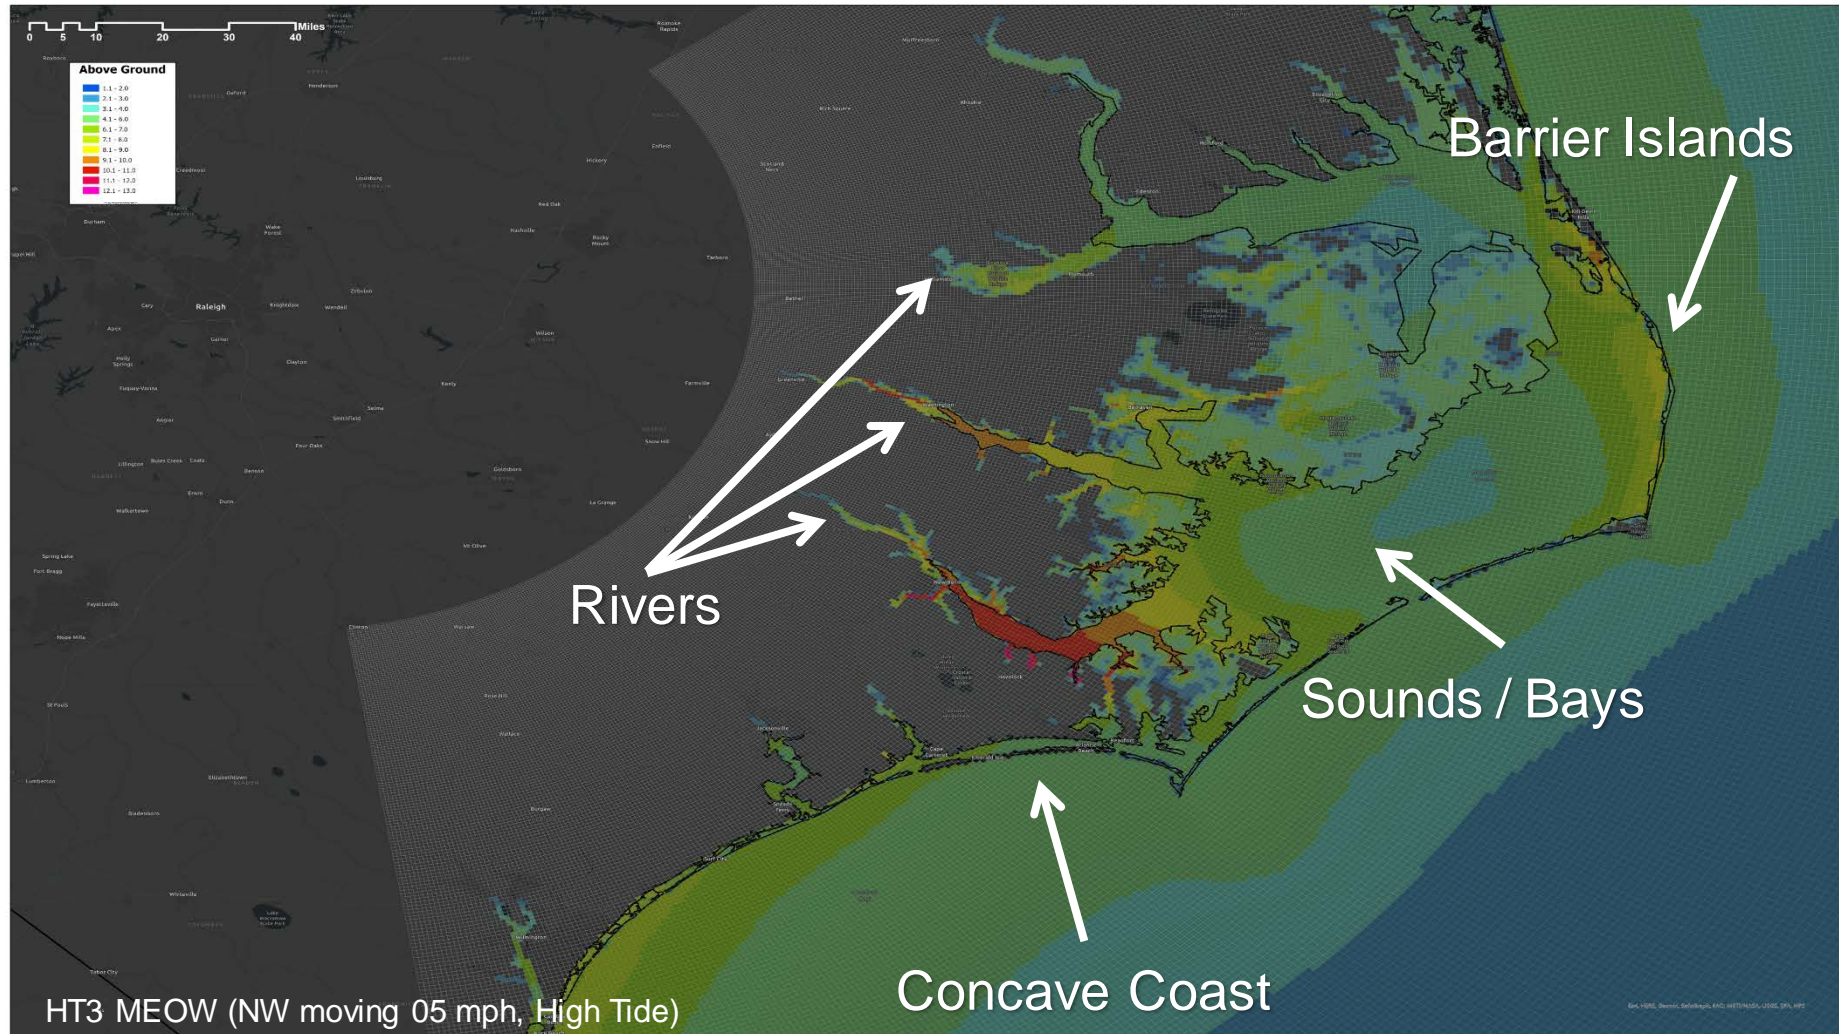

Wide shelf – Gentle slope

Narrow shelf – Sharp slope

STORM SURGE

What's the effect of local features along the coast?

MYTH OR FACT?

Storm Strength

Category 4 hurricanes always
produce more storm surge than
Category 1 hurricanes.

Myth

No More Surge in the Saffir-Simpson Scale!

(it fits like a square peg in a round hole)

Category	Wind speed			Storm surge	
	mph	km/h	kn	ft	m
Five	≥ 156	≥ 250	≥ 136	> 18	> 5.5
Four	131–155	210–249	114–135	13–18	4.0–5.5
Three	111–130	178–209	96–113	9–12	2.7–3.7
Two	96–110	154–177	83–95	6–8	1.8–2.4
One	74–95	119–153	64–82	4–5	1.2–1.5
Additional classifications					
Tropical storm	39–73	63–117	35–63	0–3	0–0.9
Tropical depression	0–38	0–62	0–34	0	0

Making the Perfect Storm Surge Forecast

SLOSH MODEL

Sea, Lake, and Overland Surges from Hurricanes

A numerical model used
to estimate storm surge
heights for historical,
hypothetical,
or predicted hurricanes

SLOSH

Strengths and Limitations

- SLOSH **does include**:
 - Flow through barriers/ gaps/ passes
 - Deep passes between bodies of water
 - Inland inundation (wet/dry cell)
 - Overtopping of barrier systems, levees, and roads
 - Coastal reflection (coastally trapped Kelvin waves)
 - Astronomical tide
 - Wave setup in U.S. Island states and territories
- SLOSH **does not include**:
 - Wave run-up (efforts underway)
 - Normal river flow and rain

National SLOSH MOM and Risk Analysis

About 7.4 million people vulnerable to storm surge

Roughly 4,600 miles of evacuation route becomes inundated or cut off

Almost 3.9 million housing units vulnerable to surge

National Hurricane Center Storm Surge Risk Maps

This is not a real-time product. For active tropical cyclones, please see hurricanes.gov and consult local products issued by the National Weather Service

This national depiction of storm surge flooding vulnerability helps people living in hurricane-prone coastal areas. These maps make it clear that storm surge is not just a beachfront problem, with the risk of storm surge extending many miles inland from the immediate coastline in some areas. Storm Surge Risk Maps are provided for the US Gulf and East Coasts, Hawaii, Southern California, US territories - Puerto Rico, US Virgin Islands, Guam and American Samoa. Additional mapped areas include Hispaniola and parts of the Yucatan Peninsula.

- CIFDP- C Demonstration Project

History of CIFDP-C

- At the 5th meeting of the CIFDP Program Steering Group (May 20 14, Geneva), the previous Sub-Project for Dominican Republic (CIFDP- DR) was re- scoped for a Caribbean/ regional approach and denoted CIFDP- C
- CIFDP- C was initially demonstrated and tested for the **Dominican Republic** and **Haiti**
- RSMC Miami provided the leading **technical contribution**, in collaboration with the PSG and other partners, which ensured the maximum synergies of regional and national efforts **and introduced a new direction to provide storm surge information to all other Caribbean countries**

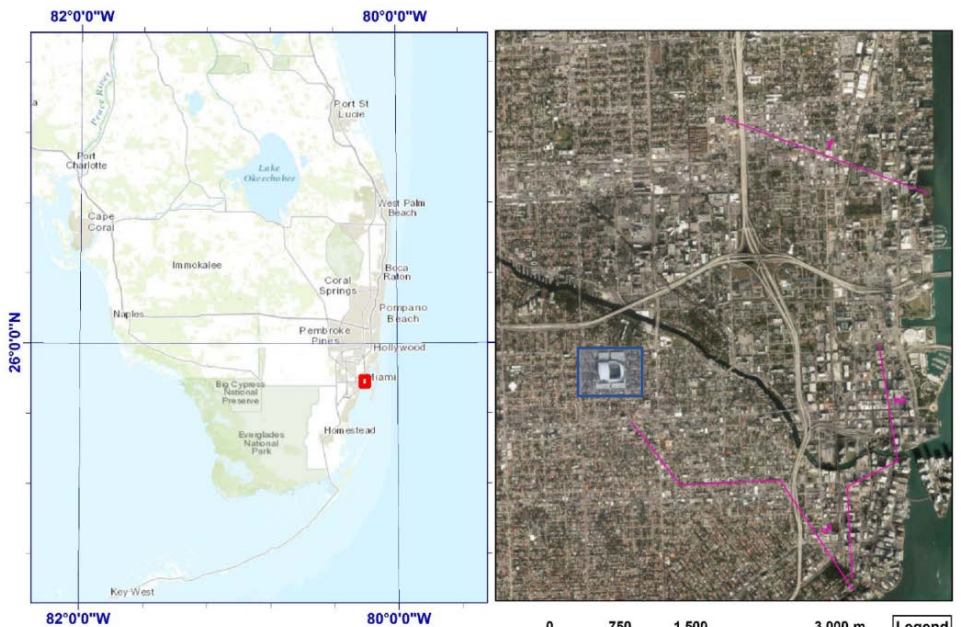

TanDEM-X

Requirements	Specification	DTED-2	TanDEM-X DEM
Relative Vertical Accuracy	90 % linear point-to-point error over a 1° by 1° cell	12 m (slope < 20 %) 15 m (slope > 20 %)	2 m (slope < 20 %) 4 m (slope > 20 %)
Absolute Vertical Accuracy	90 % linear error	18 m	10 m
Relative Horizontal Accuracy	90 % circular error	15 m	3 m
Absolute Horizontal Accuracy	90 % circular error	23 m	10 m
Spatial Resolution	Independent pixels	30 m (1 arc sec @ equator)	12 m (0,4 arc sec @ equator)

SLOSH + Waves Development

Coastal Inundation Forecasting Demonstration Project (CIFDP)

- Implement a coupled storm surge and wave modeling system
 - SLOSH hydrodynamic model
 - Wave model recommended by IOOS modeling testbed (parametric)
- Develop products for planning, preparedness, and forecasting
 - SLOSH MOMs and MEOWs
- Provide specialized training programs on how to use the storm surge products for planning and preparedness

2nd Gen (Parametric) Wave Model

An efficient parametric wave model to couple with SLOSH

Parametric models that reduce full solution space $N(t,x,y,\sigma,\theta)$, to e.g. $M(t,x,y)$ (Schwab et al. 1984).

$$\frac{\partial \vec{M}}{\partial t} + \vec{v} \cdot \nabla_{x,y} \vec{M} = \vec{\tau}_w$$

$$\vec{\tau}_w = 0.028 \rho_a D_f |\vec{U} - 0.83 C_p| (\vec{U} - 0.83 C_p)$$

$$\sigma^2 = 6.23 \times 10^{-6} \left(\frac{f_p U}{g} \right)^{-10/3} \frac{U^4}{g^2}$$

- Simplified physics, but significantly cheaper than SWAN or WW3

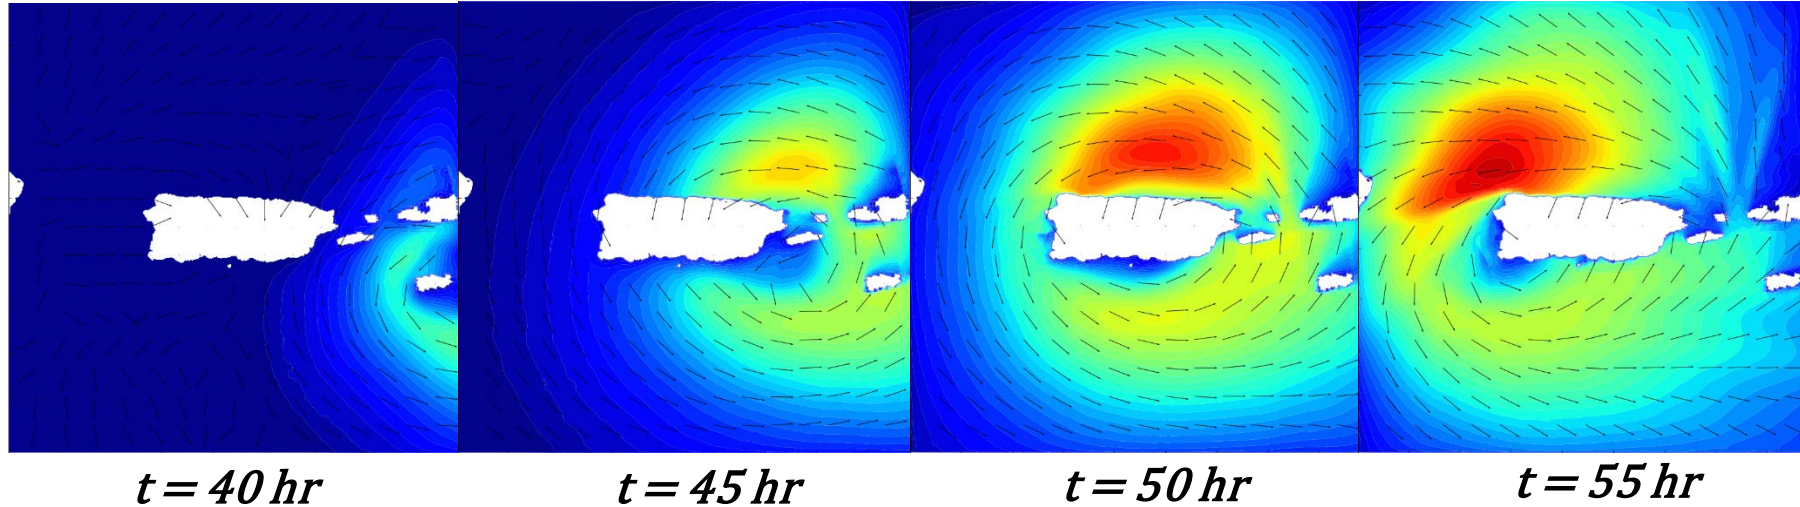

More suitable to couple with SLOSH
