TC intensity model spread

0%

Alternative TC-track solutions

0%

The correct track will always be within the spread

0%

Why Aren't Models Perfect?

- Atmospheric variables cannot be measured to an infinite degree of accuracy or precision (measurement error)
- Models' initial state never matches the real atmosphere (analysis error)
- Initial condition errors grow with model integration time, most rapidly at smaller scales (error growth)
- Model equations do not fully represent all of the processes in the atmosphere (model error)
- Model grid cannot explicitly resolve all features and processes in the atmosphere (model error)

Options?

- Increase our understanding of physical processes and how models represent them (**research**)
- More accurate and numerous observations with greater coverage (**expensive**)
- Improved data assimilation methods (**4-D Variational Data Assimilation, Ensemble Kalman Filter**)
- Faster computers and more complex models (**many programs competing for resources**)
- *Probabilistic forecasting with ensembles*

Deterministic vs Ensemble

- **Deterministic** - single forecast from one forecast model or method using a single set of initial conditions
 - Examples: GFS, ECMWF, UKMET, HMON, HWRF, HAFS
- **Ensemble** - collection of “member” forecasts verifying at the same time created from:
 - Different but equally viable initial conditions
 - Different forecasting methods and/or models that (ideally) statistically represent nearly all forecast possibilities

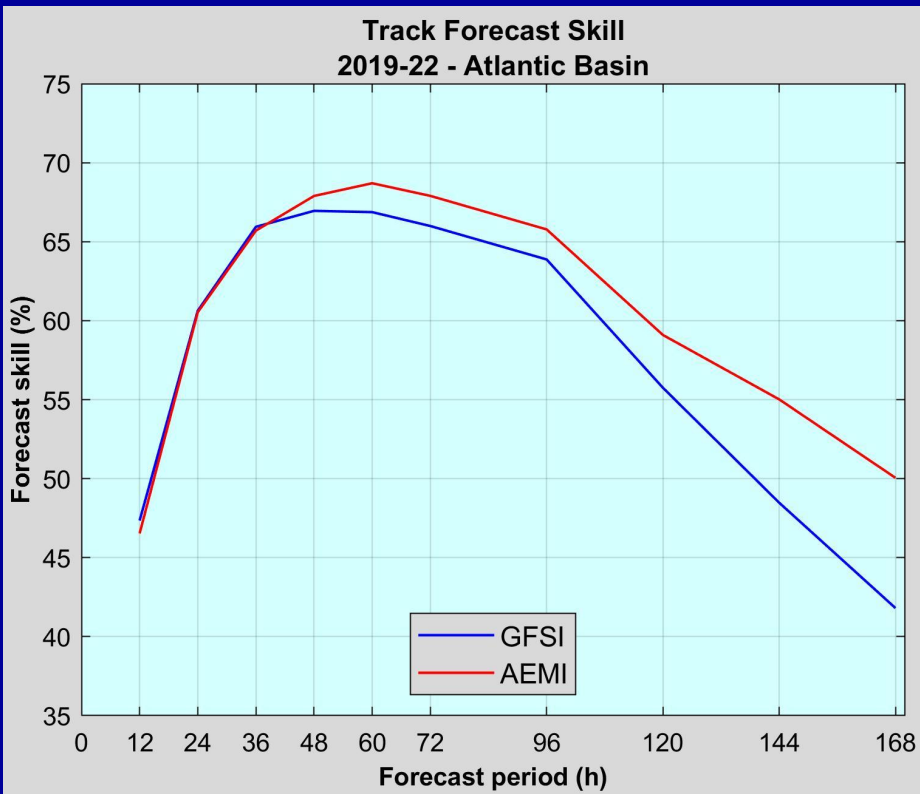

Definitions

- **Dynamical Model Ensemble** –based on perturbation of initial conditions of a single model or different models to create “member” forecasts
 - Examples: NCEP Global Ensemble Forecast System (GEFS), ECMWF Ensemble Prediction System (EPS)
- **Control Run** – for dynamical model ensembles, usually the member of the ensemble run with the “best” initial analysis
 - The analysis used by the control run is usually perturbed to produce initial conditions for the remaining ensemble members
- **Spread** – measure of the degree of disagreement (i.e., standard deviation) between ensemble members

Ensemble Mean vs. Deterministic

- Deterministic runs (e.g., GFS) usually have more skill than any *individual ensemble member* due to superior resolution
- Ensemble mean usually has at least as much skill as an *equal-resolution control run*
- Ensemble mean can be more skillful than a *higher-resolution deterministic run*, especially beyond ~3 days

GEFS Mean vs. GFS (2019-2022)

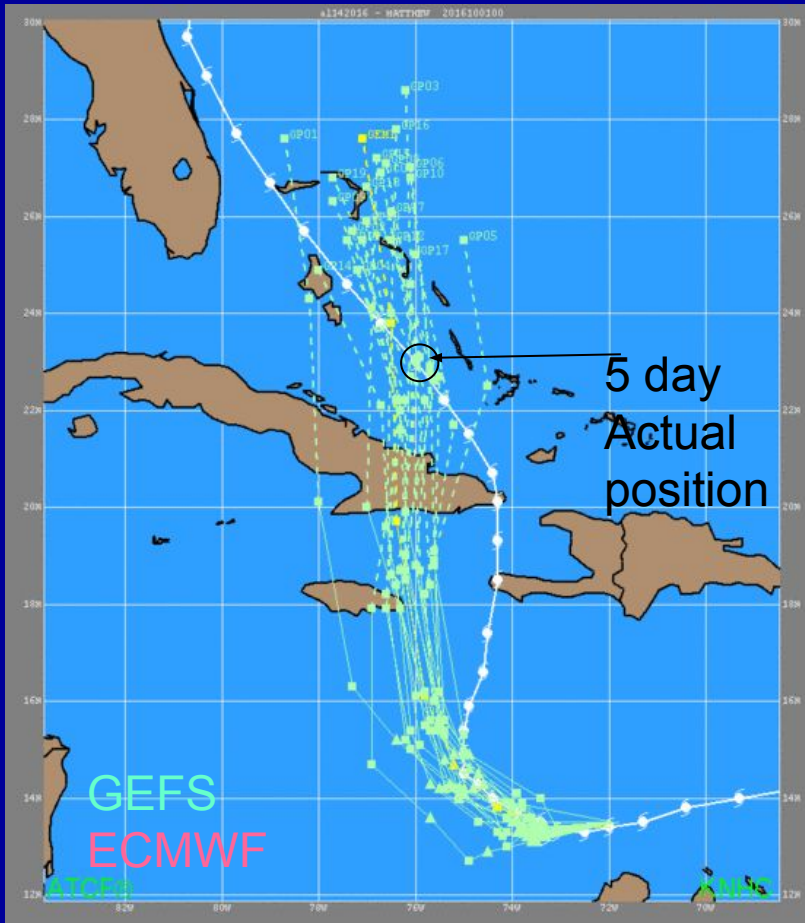

In the Atlantic, the GEFS ensemble mean track forecast (**AEMI**) is competitive with the deterministic GFS (**GFSI**) through 36 h and better afterward

Eastern Pacific – ensemble better at all times

Matthew ensemble guidance 1 Oct 00 UTC

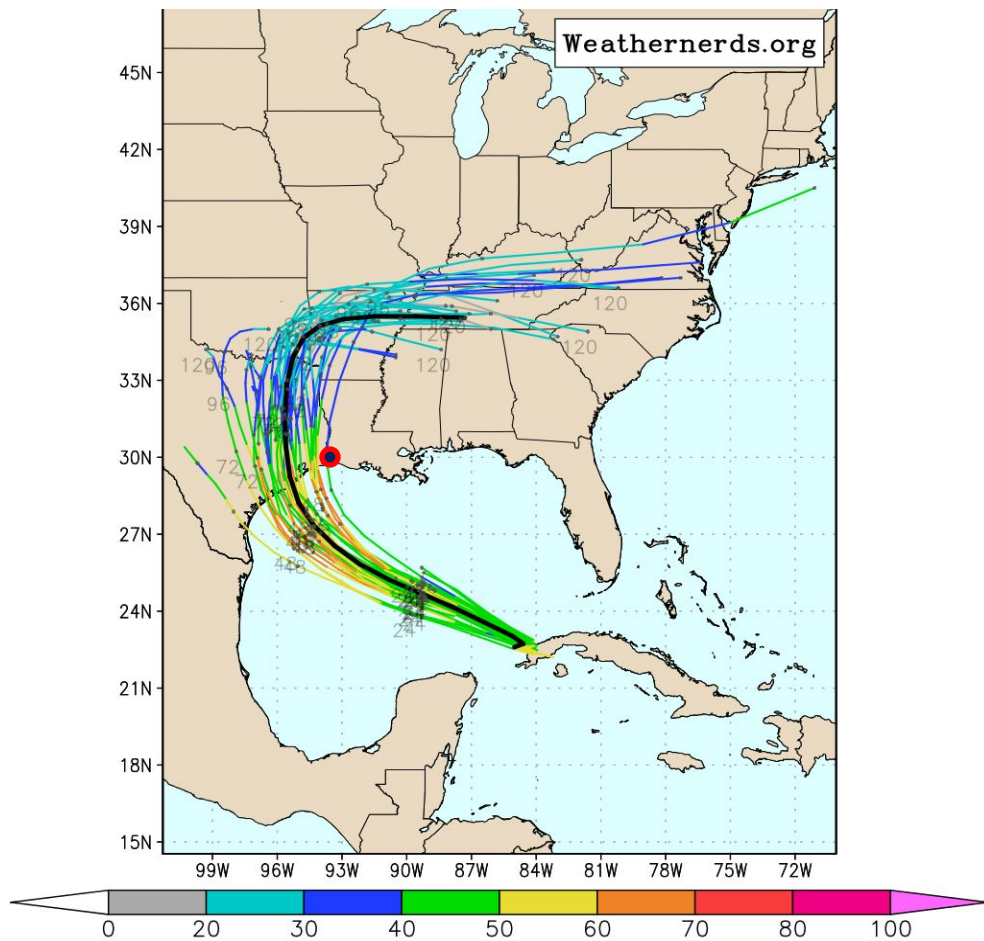

Old GEFS pre-2020 (blue) too underdispersive, especially in Caribbean

Every single GEFS member also too fast at 5 days

ECMWF (red) has more realistic spreads, albeit potentially too large

ECMWF ensemble tracks for Laura at Aug 25 0000 UTC

Every member was too far west

Don't just worship at the altar of the ECMWF!

Single-Model Ensembles for TC Track Forecasting

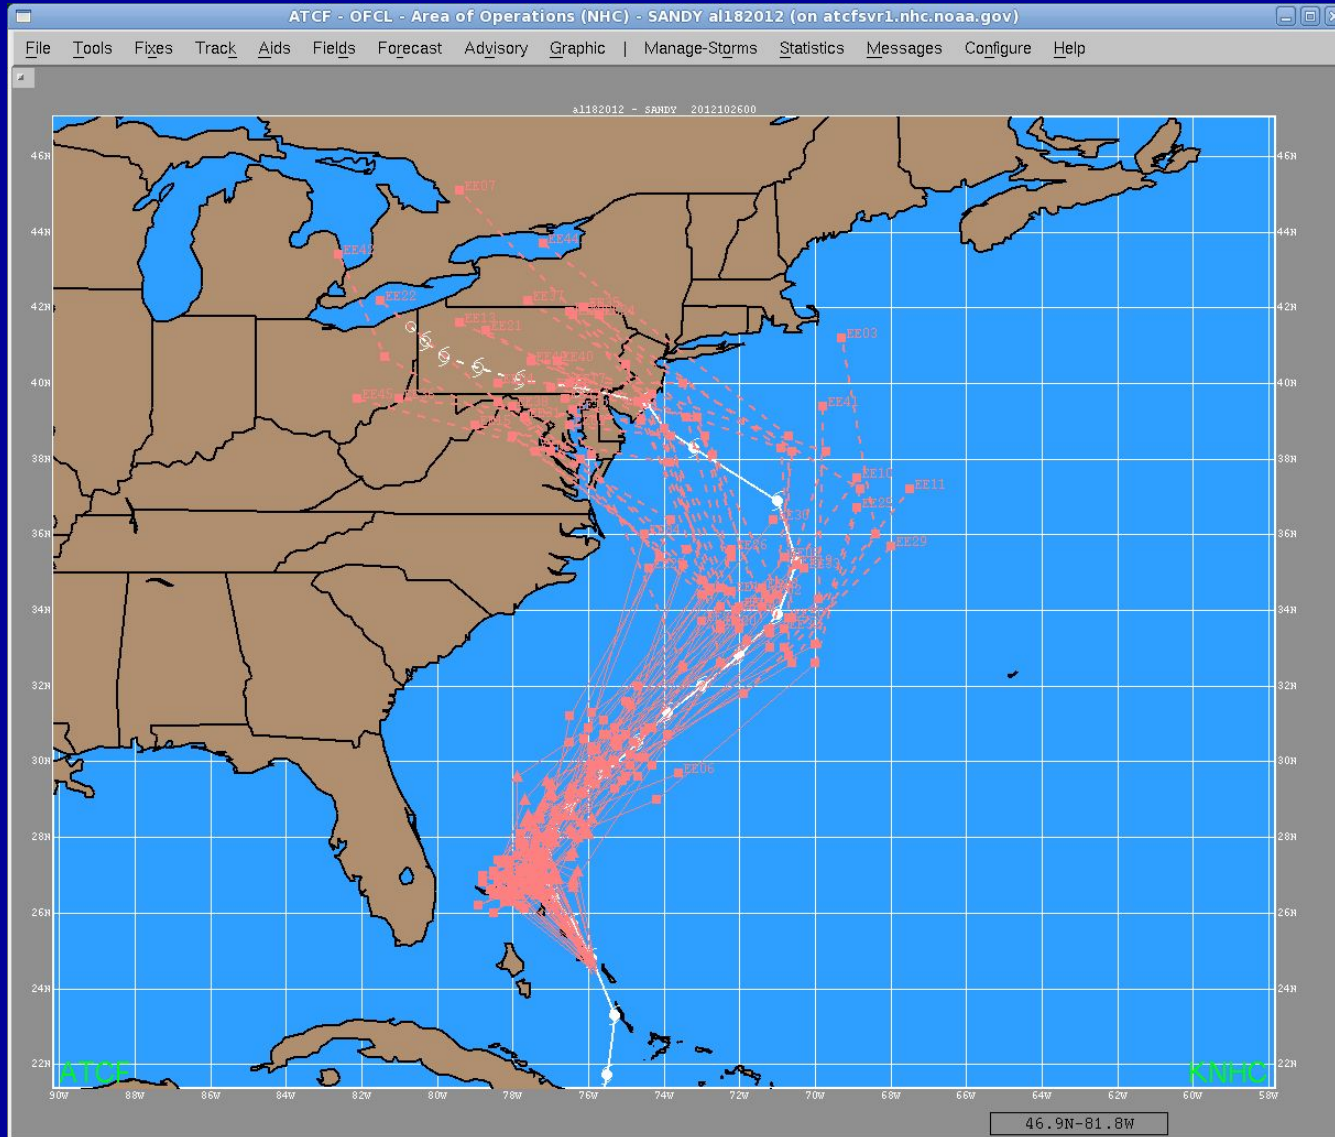

NCEP Global Ensemble Forecast System

Tropical Cyclone Track Forecast Guidance

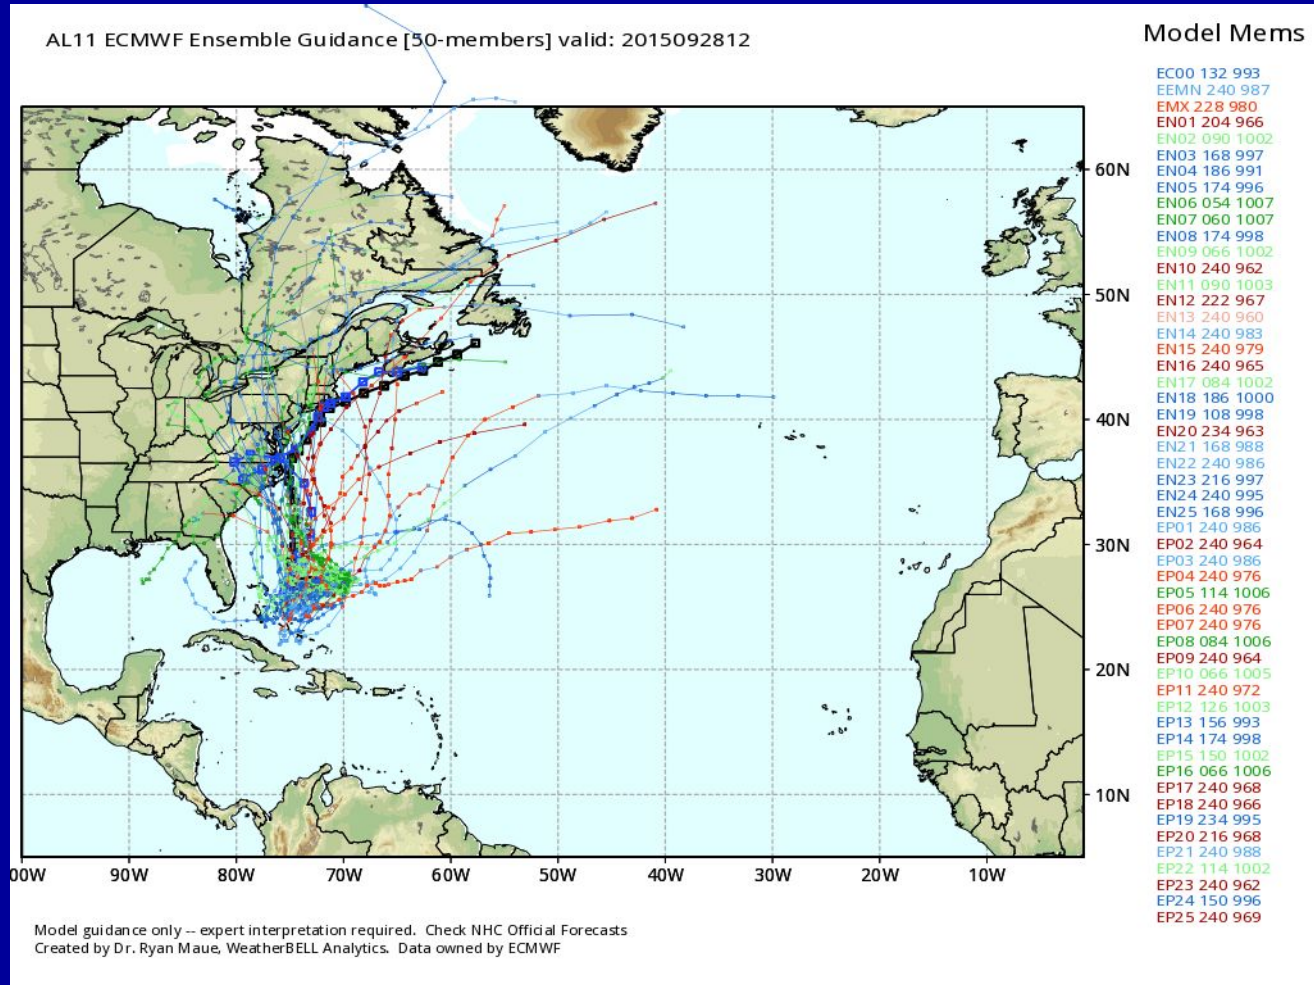

ECMWF Ensemble

Sandy example of desirable spread/verification

Track dependent on intensity?

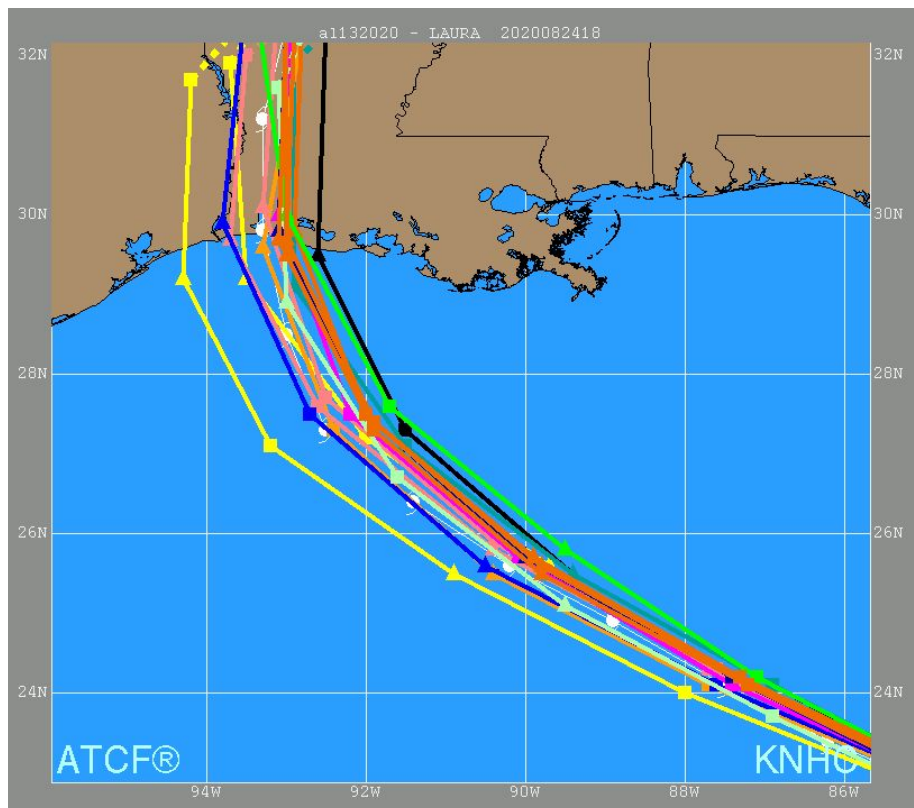

-Stronger members farther right
-Weaker members farther north

Ensemble Problems

- Need a properly calibrated system
 - GEFS used to be underdispersive (much better since upgrade)
 - This problem results in an overconfident forecast (UKMet ensemble has this more than EPS/GEFS now)
 - Lower resolution can also hinder a more accurate track forecast (i.e. when track especially dependent on intensity)
- Other issues
 - Ensemble mean can be misleading (and may not be the best forecast) if multiple clusters of nearly equal probability forecast outcomes exist (i.e., bi-modal distribution)
 - May not reveal extreme outlier solutions

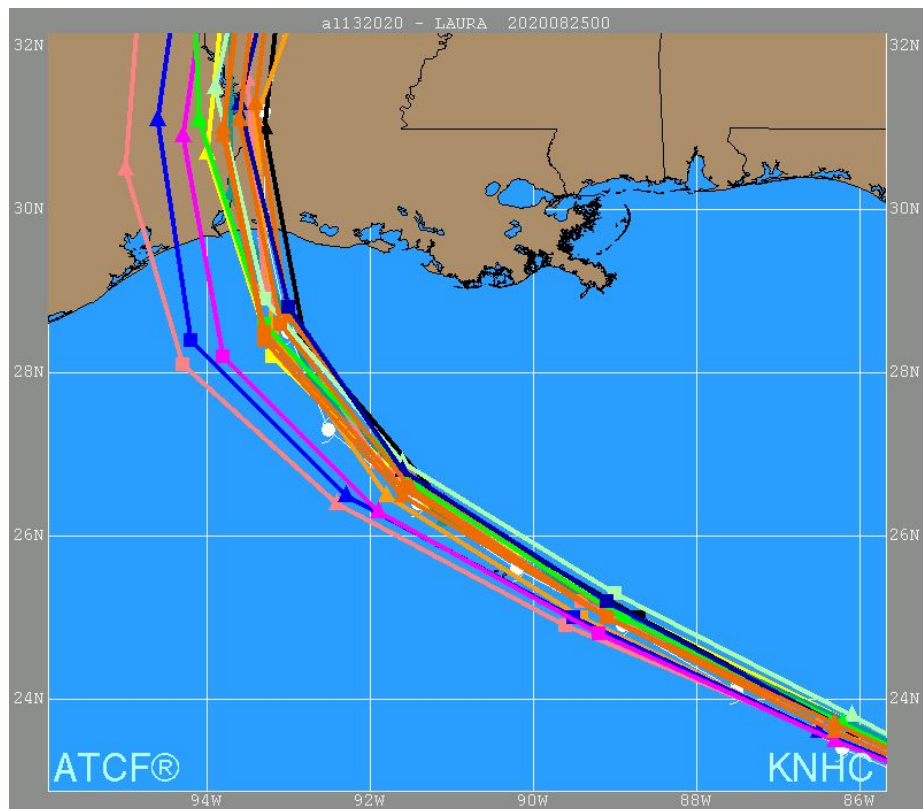

Incorrect Model Trends Near Landfall - Laura

Guidance almost perfectly centered around the Louisiana landfall

Laura guidance 1800 UTC Aug 24

Incorrect Model Trends Near Landfall - Laura

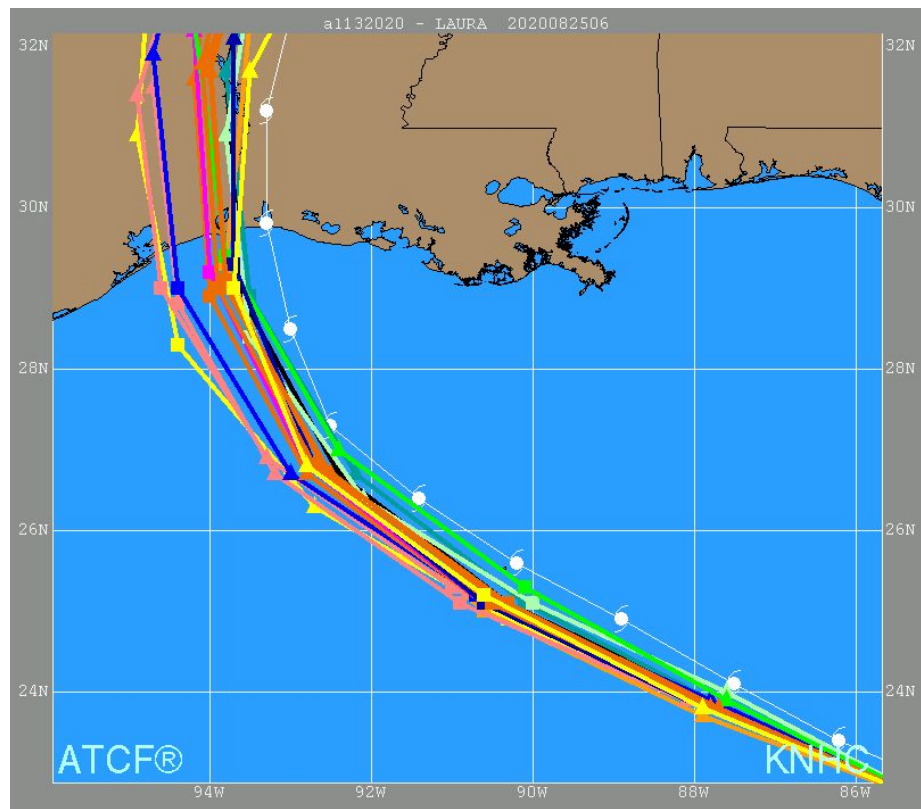

Laura guidance 0000 UTC Aug 25

6 hours later- trouble.

Notable westward shifts of
ECMWF ensemble and
corrected-consensus aids

Incorrect Model Trends Near Landfall - Laura

Laura guidance 0600 UTC Aug 25

Lots of models shifted west

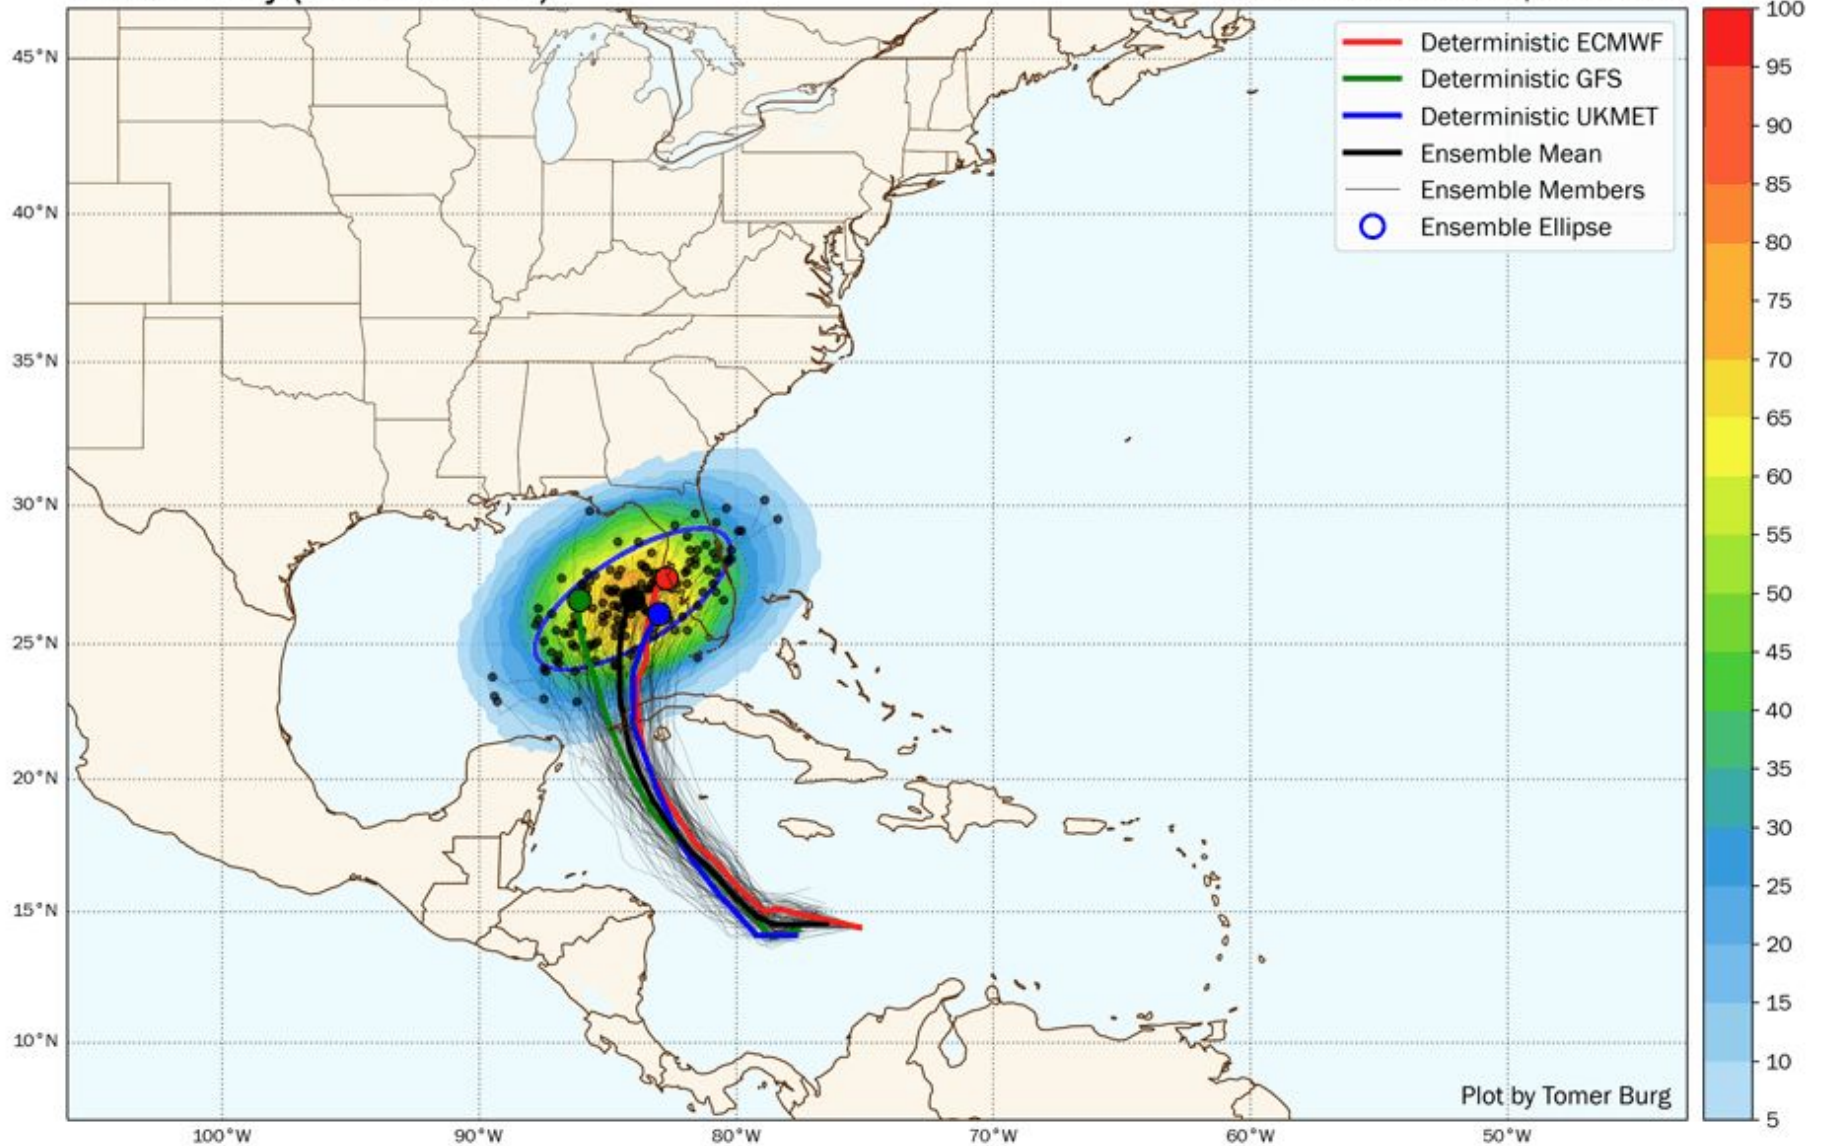

NHC fcst did not leave LA

Expectation of a deep hurricane/SW winds in high-levels led NHC to stay on the E side of the guidance

Huge Houston evacuation implications

Ian Super-ensemble (EPS + GEFS + UKMET + CMC) Track Density (350-km radius)

Hour 96 | Valid 0000 UTC 29 September 2022
Initialized 0000 UTC 25 September 2022

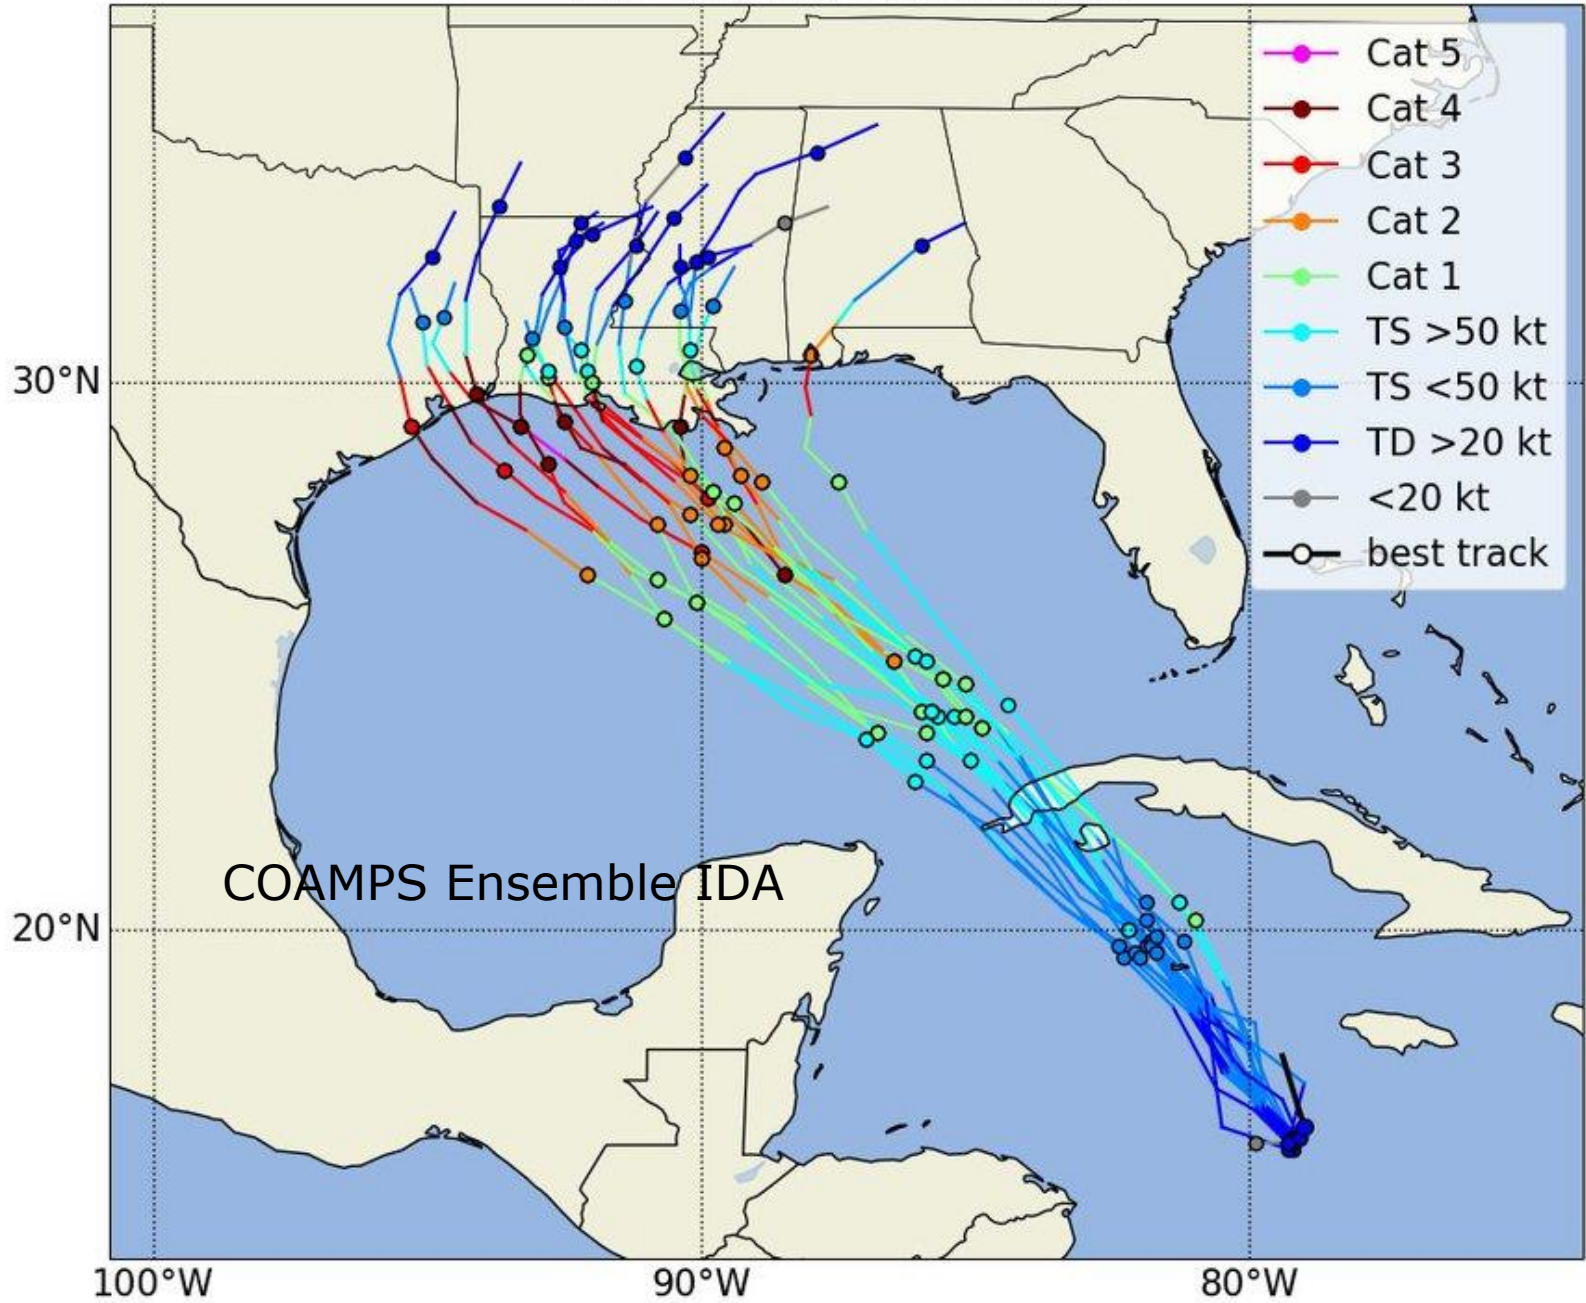

Wave of the future – put all systems together and use probabilities?

TC Intensity Ensemble Forecasting

- **Some skill above single-model deterministic**
- **Very computational expensive to run high-resolution (<3 km) intensity ensembles**
- **HFIP is funding efforts to find products that could be operationally useful**

TC = 09L, DTG = 2021082612

Access to ensemble mean, spread, and spaghetti plots

“Good” and “Bad” Ensembles

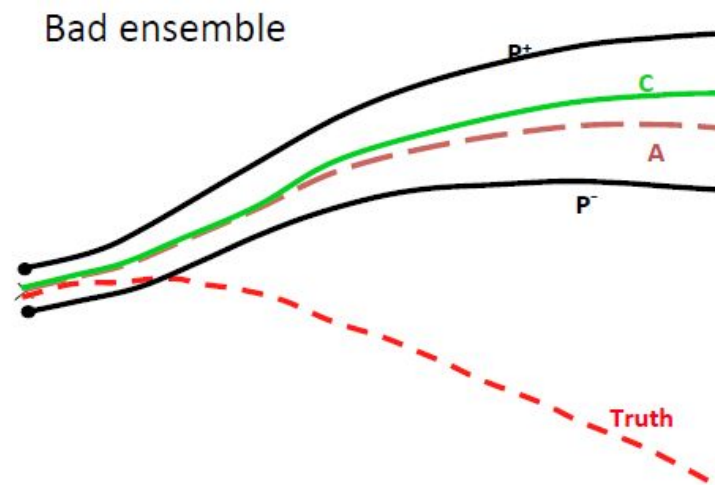

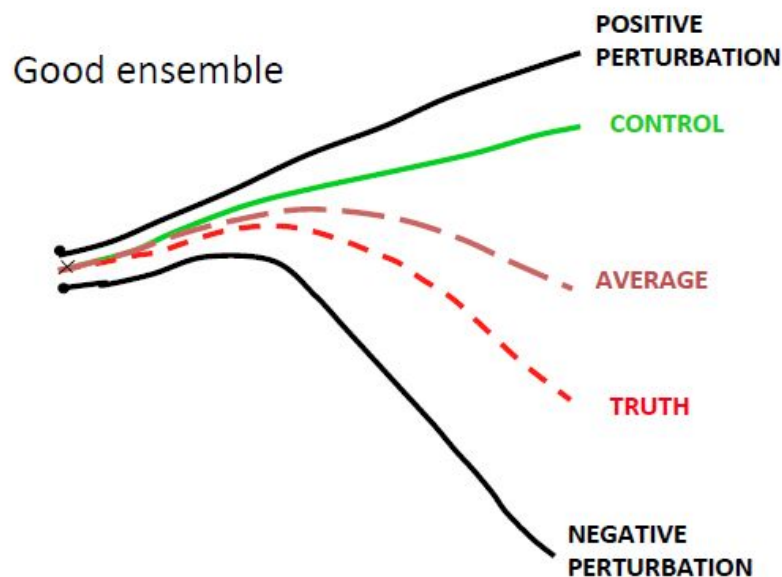

An ensemble forecast starts from initial perturbations to the analysis...

In a good ensemble “truth” looks like an member of the ensemble

(Toth, 1992)

The initial perturbations should reflect the analysis “errors of the day”

A bad ensemble is still useful (implies there is a bug in the system)

Kalnay 2019

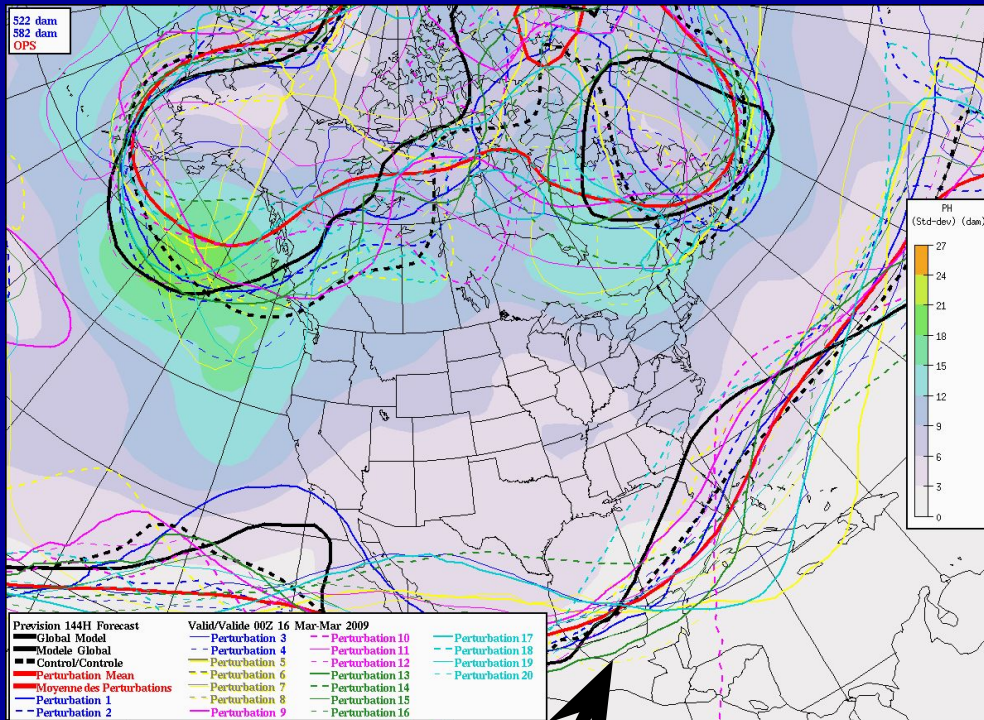

Question 1

What are some current advantages of using single-model ensembles?

- A. Estimates of uncertainty
- B. TC intensity model spread
- C. Alternative TC-track solutions
- D. All of the above
- E. A & C

Ensemble mean and spread: four standard parameters

On this page you can visualise output from the ECMWF 'Ensemble Prediction System' (ENS), for four parameters: **mean sea level pressure, 850 hPa temperature, 850 hPa wind speed and 500 hPa geopotential height.**

These charts are updated once every 12 hours at approximately 08:30 UTC and 20:30 UTC. Each chart header is labelled with the date and time when the ensemble forecasts were initiated (D0), which will be 00UTC for the 08:30 UTC update, and 12UTC for the 20:30 UTC update. Each map is then valid for a date between D0 + 1 and D0 + 10days, which is indicated in the chart header by VT (=Valid Time) and which can be adjusted using drop down menus above the plot (grey boxes). Additional drop down

Question 1

What are some current advantages of using single-model ensembles?

- A. Estimates of uncertainty
- B. TC intensity model spread
- C. Alternative TC-track solutions
- D. All of the above
- E. A & C

ECMWF Ensemble Prediction System

- 51 members (1 control+50 perturbed members)
- Run twice daily (00 and 12 UTC) out to 15 days, 6/18 UTC 144h
 - T639 (~ 18 km) to 15 days
 - 137 vertical levels

Perturbations:

- Generated using singular vectors and stochastically Perturbed Parameterization Tendencies Scheme (SPPT)

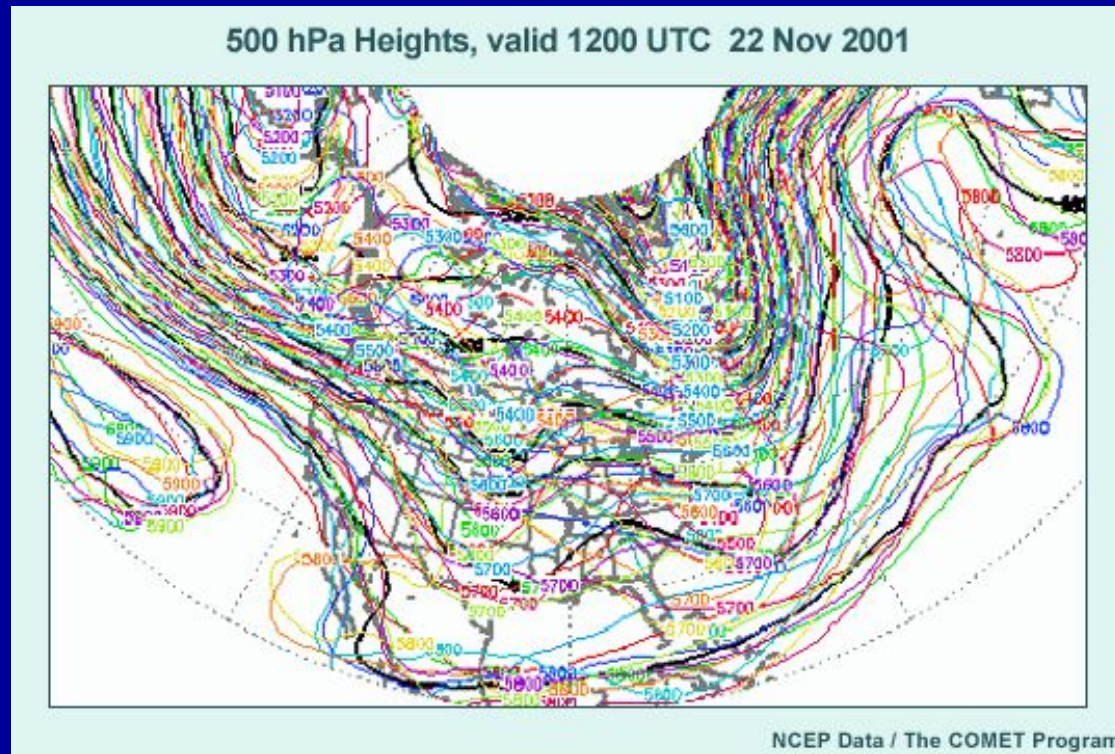

Deterministic ECMWF

- Horizontal grid resolution T1279 (~9 km) out to 10 days with 137 vertical levels

Big ensemble upgrade coming in June for horizontal resolution to match deterministic!

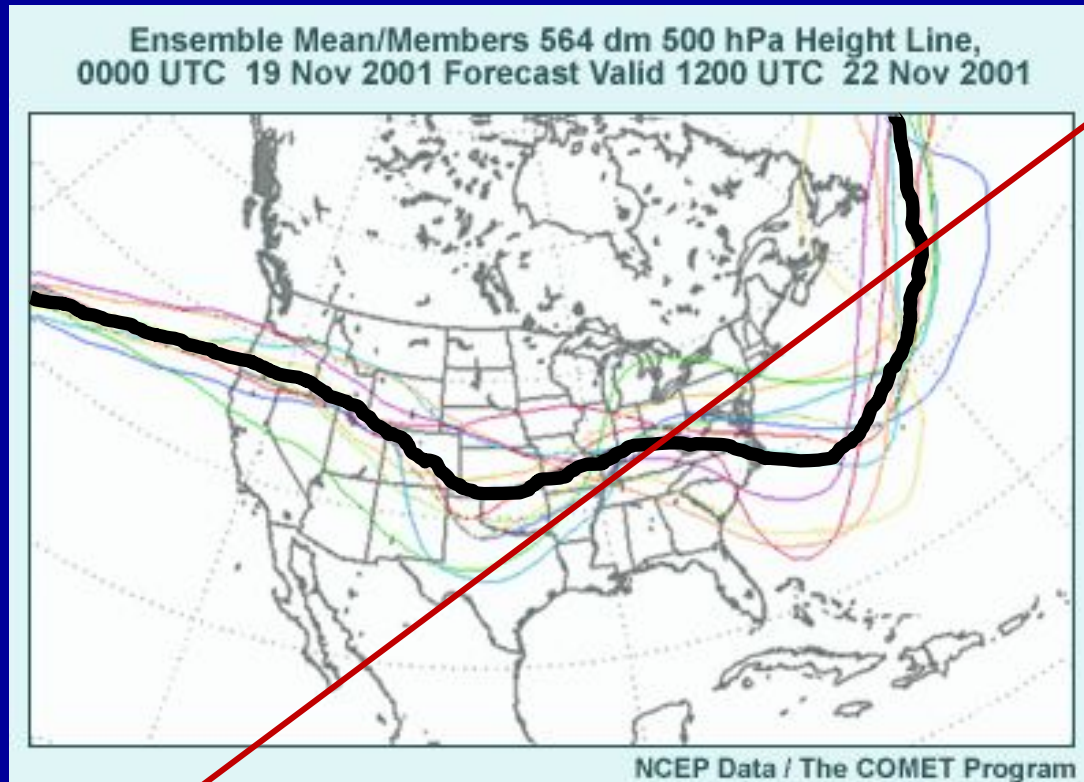

Ensemble Display and Interpretation

Displaying Ensembles

If we try to look at every ensemble member at once, it is messy and difficult to interpret

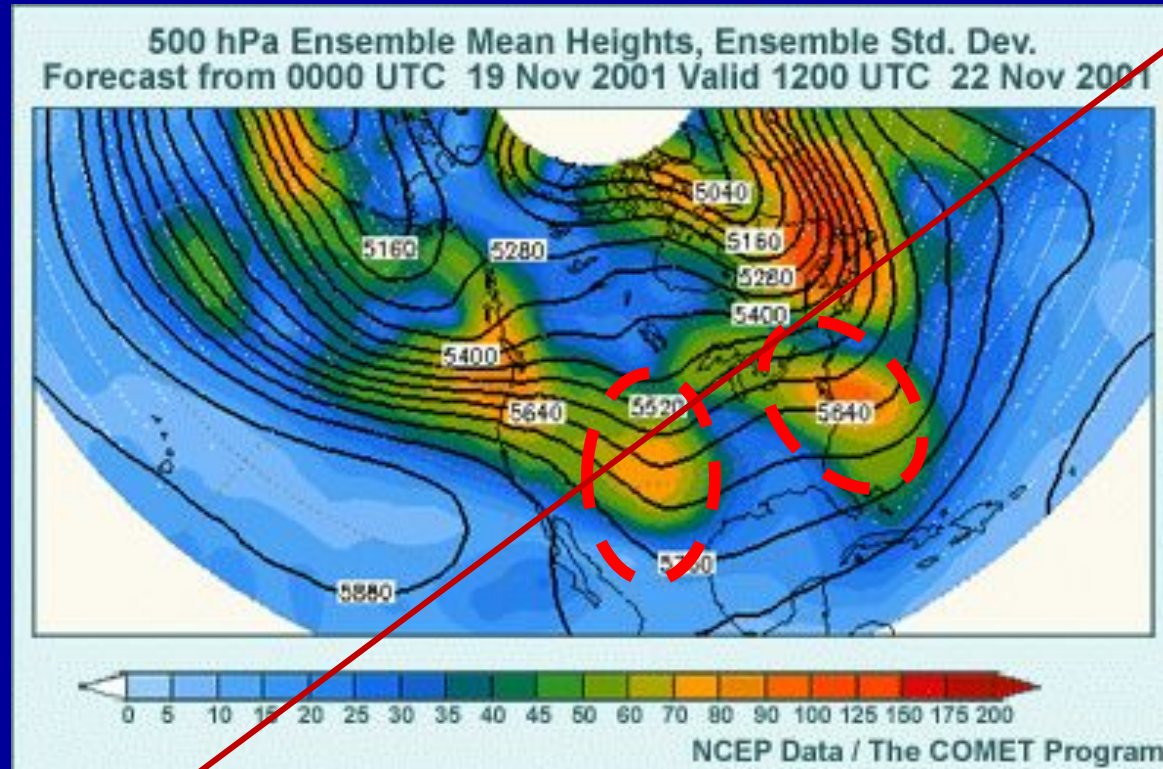

Displaying Ensembles

Ensemble Mean - average of multiple forecast members verifying at same time

Displaying Ensembles

Ensemble Mean and Spread

- **Black lines** = ensemble mean 500-mb height forecast
- Spread indicated by shading (meters)
 - **Orange/Red** – little agreement between members
 - **Blue** – good agreement between members

Displaying Ensembles

Ensemble Mean and Spread

- Advantages
 - Summarizes data in easy to interpret form
 - Information provided for the entire domain
 - Low predictability features smoothed out by the ensemble mean and easily identifiable using spread
- Disadvantages
 - Ensemble mean can be misleading (and may not be the best forecast) if multiple clusters of nearly equal probability forecast outcomes exist (i.e., bi-modal distribution)
 - May not reveal extreme outlier solutions

Interpreting Mean and Spread

Large spread within the ensemble mean feature □ **Uncertainty in amplitude of the feature**

• In this case, there is uncertainty in the **depth** (not the location) of this 500-mb trough

• If there were a tropical cyclone located southeast of this trough, would the trough be deep enough to recurve the tropical cyclone?

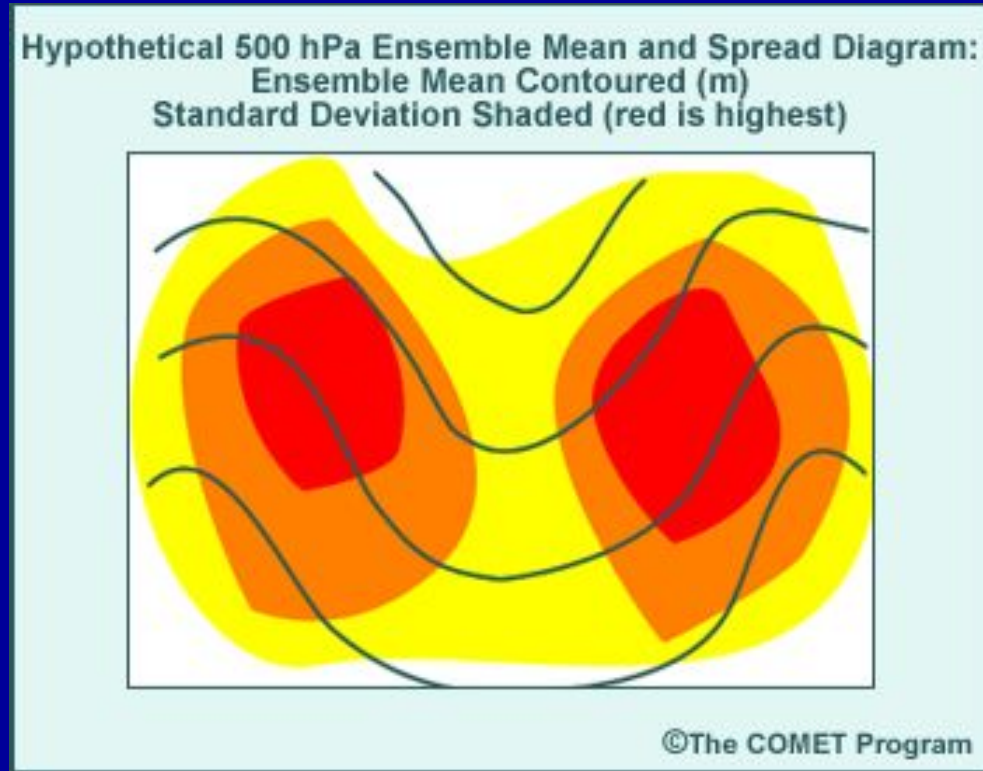

Interpreting Mean and Spread

Large spread upstream or downstream of an ensemble mean feature □ **Uncertainty in the location of the feature**

- In this case, there are nearly equal chances that the 500-mb trough will be east or west of the position shown by the ensemble mean trough

- If a tropical cyclone was located southeast of this trough, at what time will the tropical cyclone begin to be influenced by this trough?

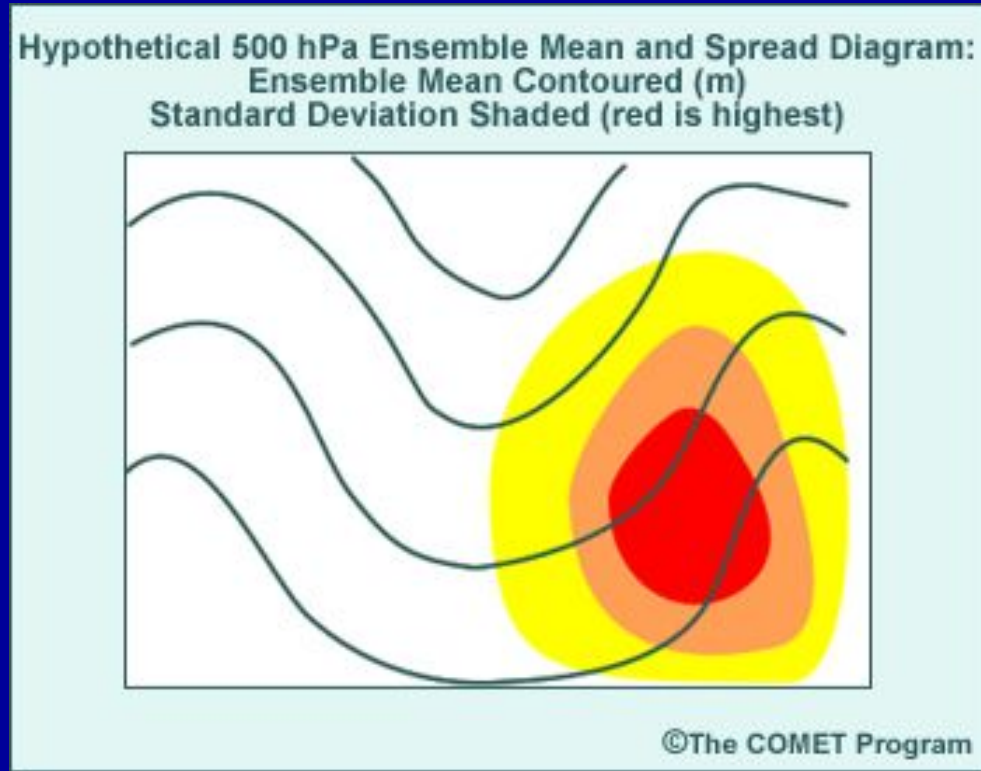

Interpreting Mean and Spread

Large spread on one side of an ensemble mean feature □ **A cluster of ensemble members different from the ensemble mean**

- In this case, the spread indicates greater potential for the trough axis to be east of the ensemble mean trough than to the west

- If there was a tropical cyclone located southeast of this trough, at what time will the tropical cyclone begin to be influenced by this trough?

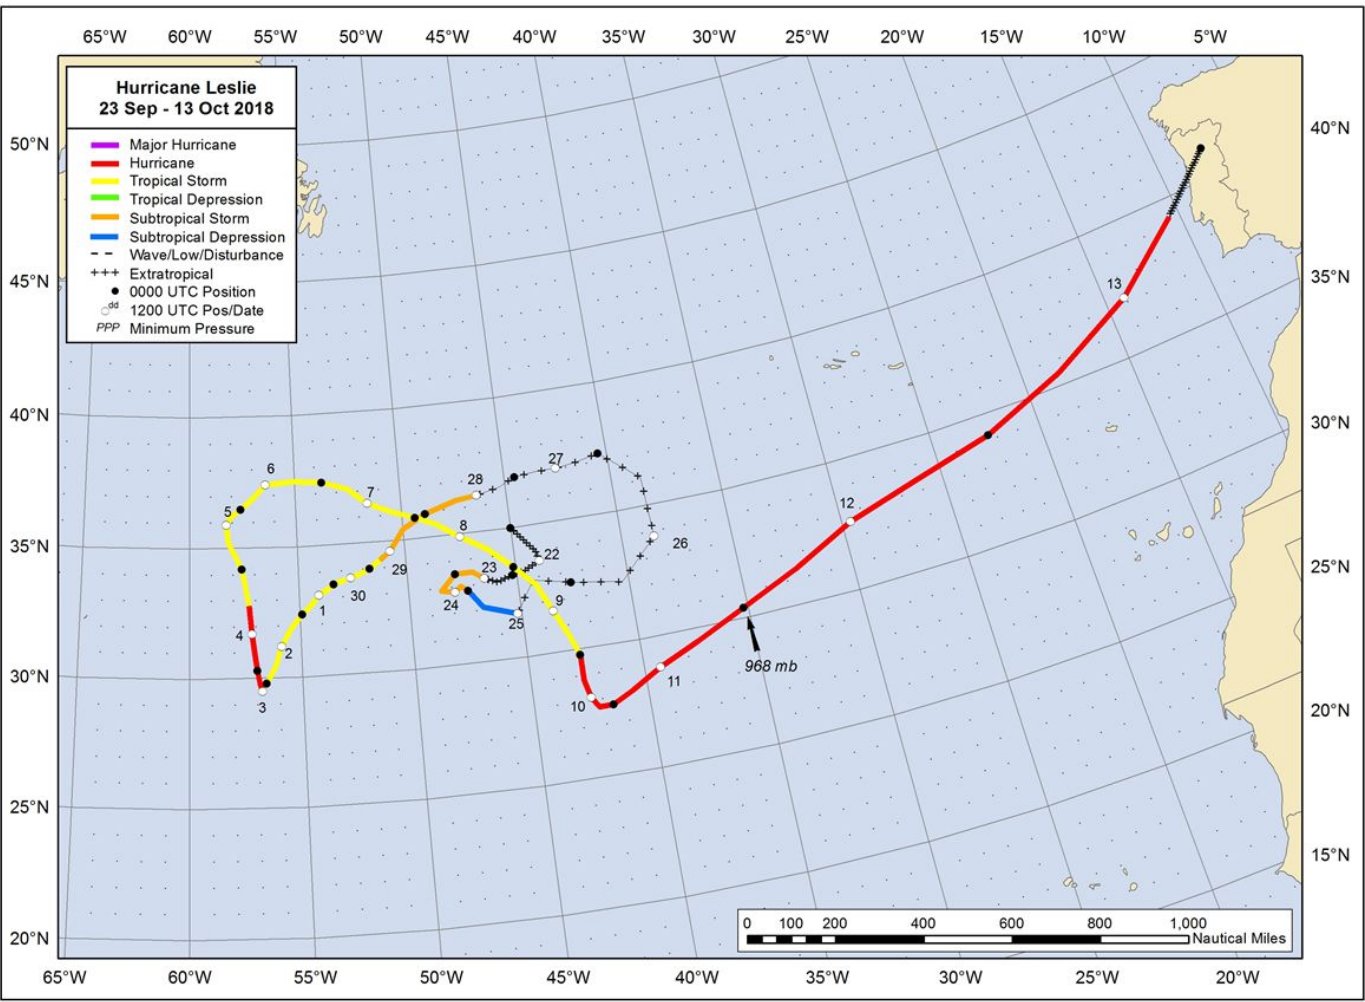

GFS Joaquin ensembles 29 Sep 1200 UTC

ECMWF Joaquin ensembles 29 Sep 1200 UTC

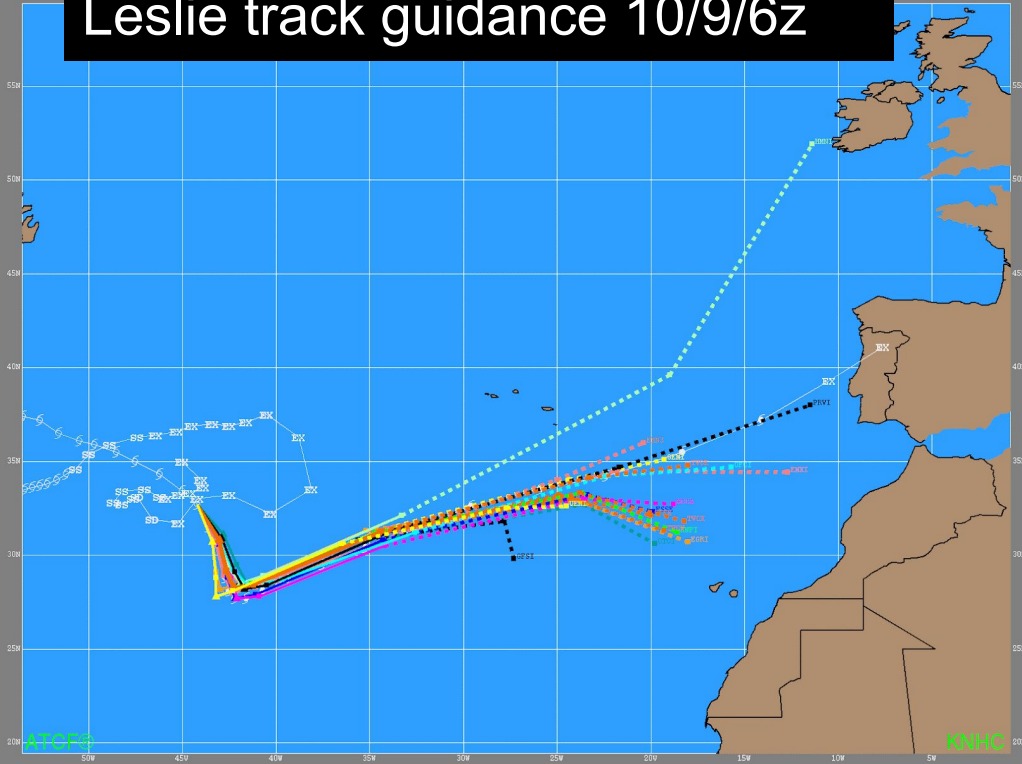

Hurricane Leslie

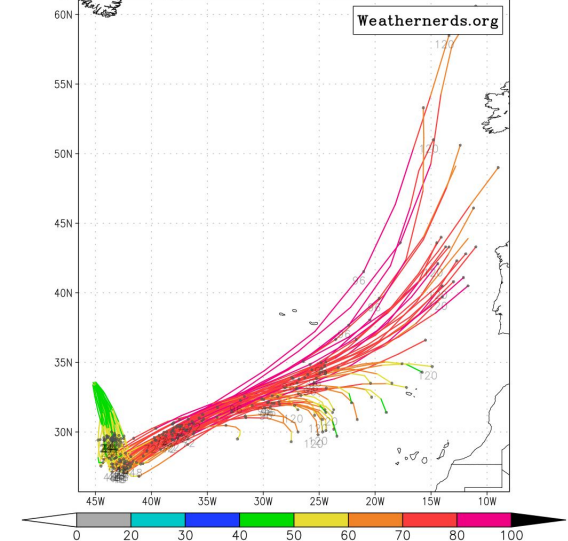

Long lasting and *highly* annoying

Leslie track guidance 10/9/6z

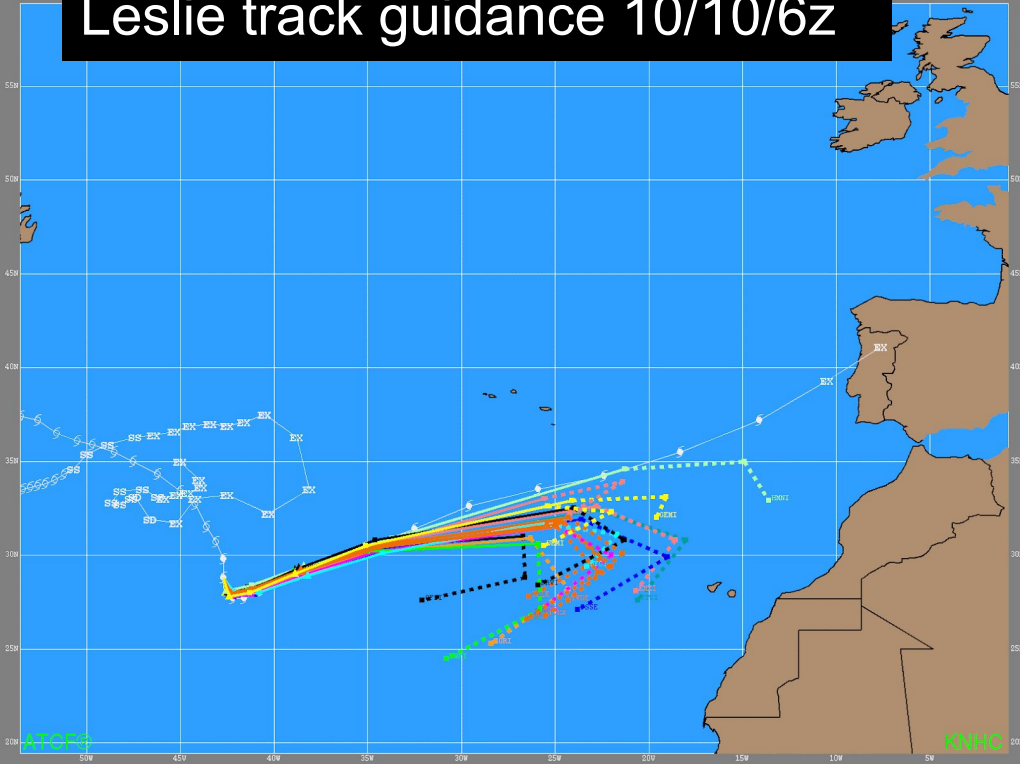

Major model spread, but best models farthest south

ECMWF Ens. (0-120h only), init: 2018100900, AL13 Leslie color = max wind (kt)

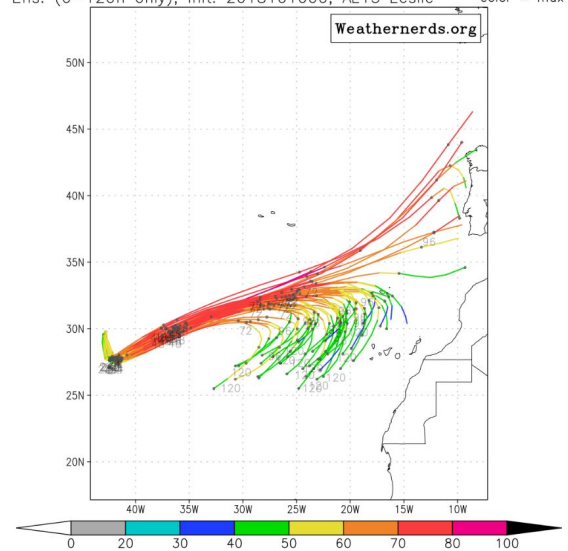

Leslie track guidance 10/10/6z

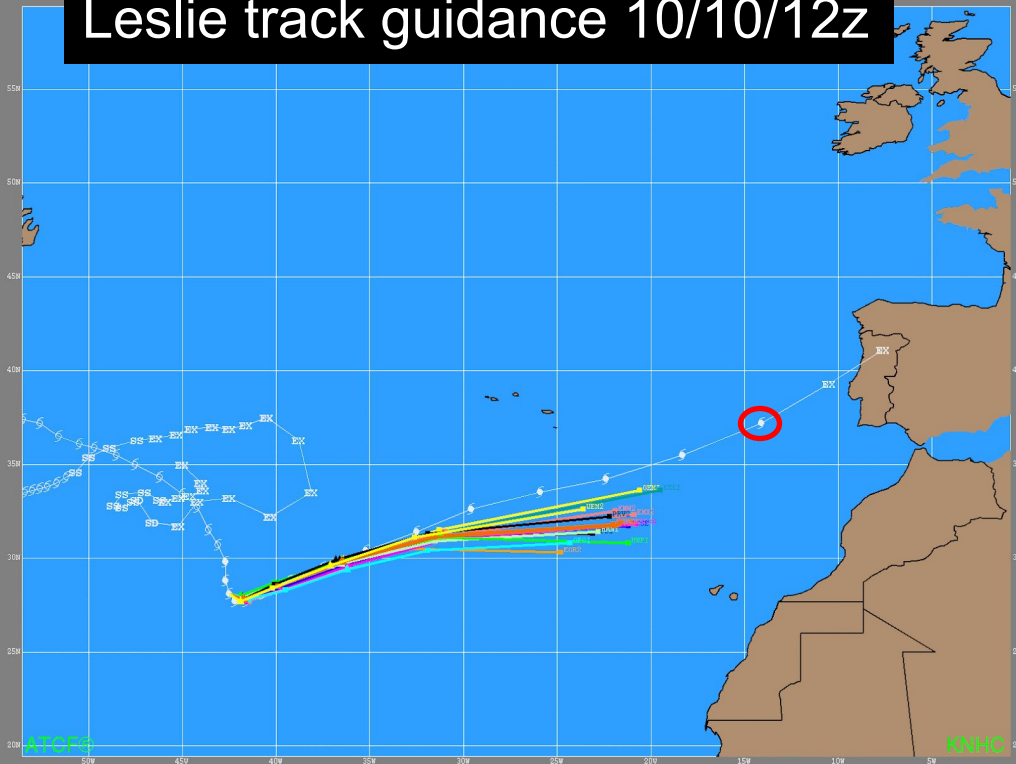

EC ensemble not as definitive

ECMWF Ens. (0-120h only), init: 2018101000, AL13 Leslie color = max wind (kt)

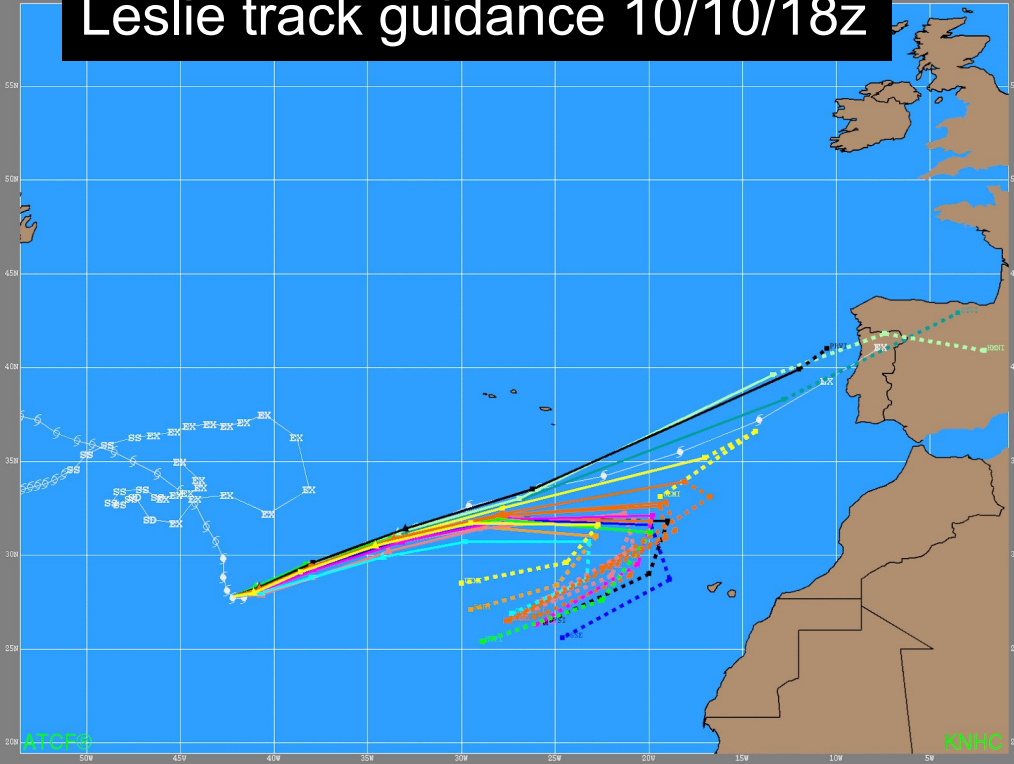

Leslie track guidance 10/10/12z

72 hour zoom

—
All models have a
400- 600 n mi error

Leslie track guidance 10/10/18z

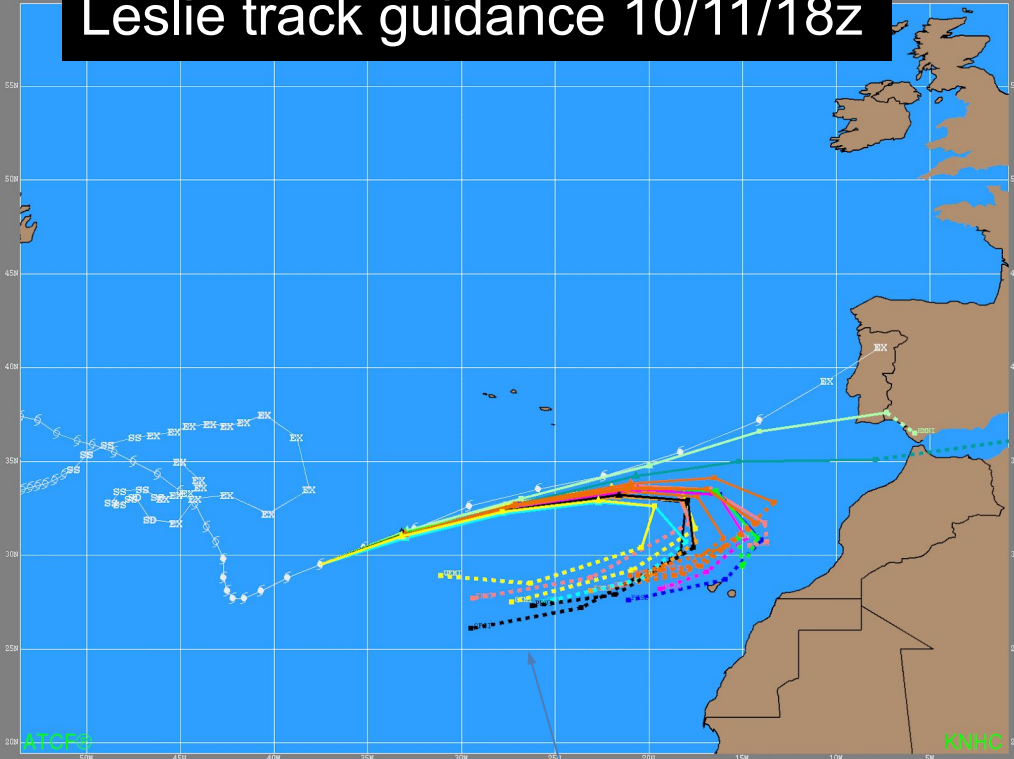

Few more models shift north, but most still miss the trough

EC ensemble continues to shift south

ECMWF Ens. (0-120h only), init: 20181012, AL13 Leslie color = max wind (kt)

Leslie track guidance 10/11/18z

Deterministic models shift south, but little change in EC ensemble

~400 n mi errors in < 48 h

GFS shifts over 1500 n mi

Leslie track guidance 10/12/6z

Models mostly jump northward

ECMWF Ens. (0-120h only), init: 2018101200, AL13 Leslie color = max wind (kt)

Leslie track guidance 10/12/18z

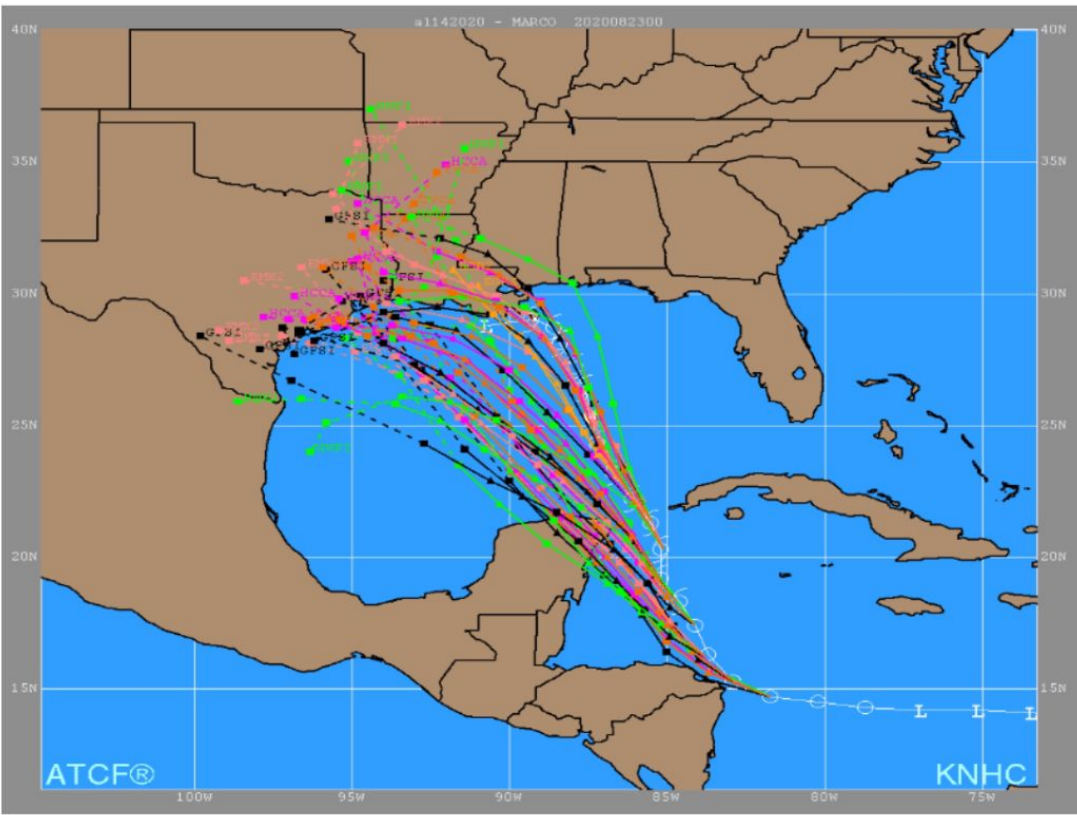

Finally!

ECMWF Ens. (0-120h only), init: 2018101212, AL13 Leslie color = max wind (kt)

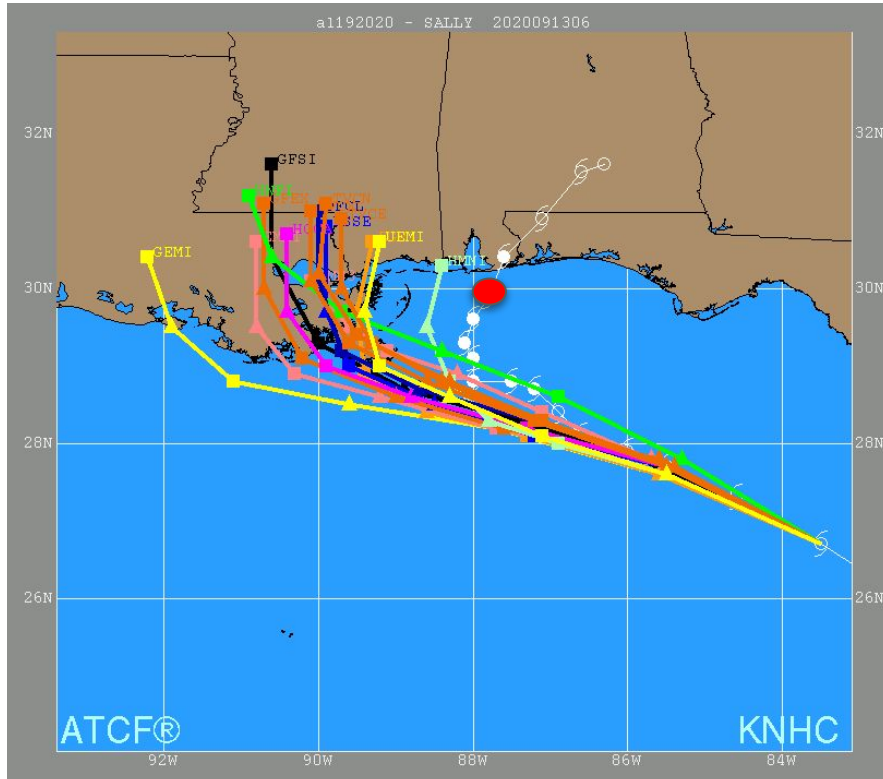

Track Forecast Challenges - Marco

Potential interaction between Marco and Laura as well as uncertainty about Marco's intensity led to huge variability in track guidance for Marco and poor forecasts

Marco track guidance 21-23 August 2020

Track/Warning Forecast Challenges - Sally

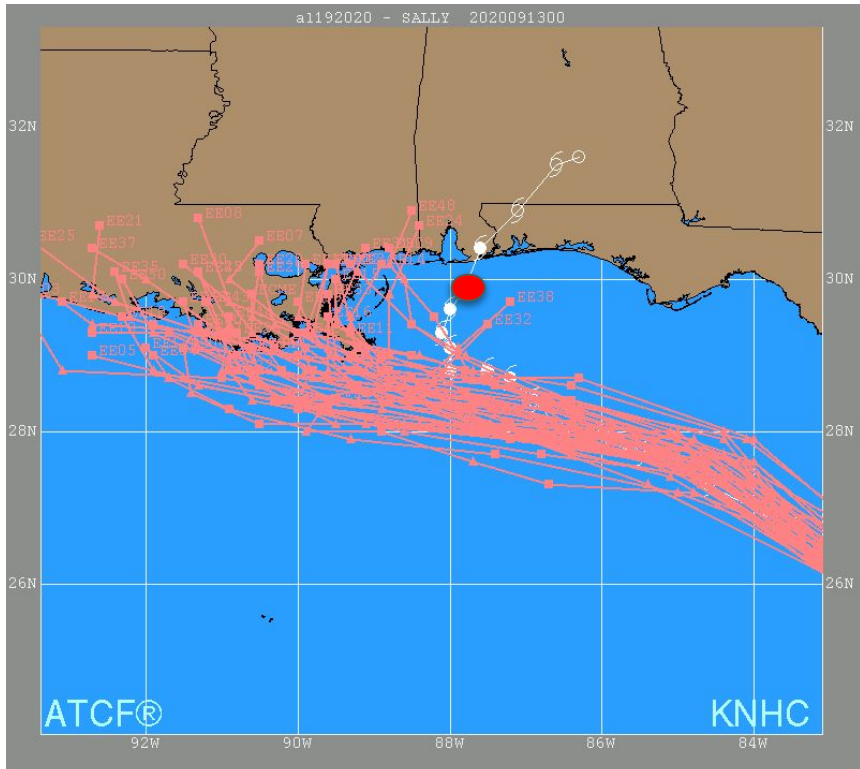

Track guidance 0600 UTC 13 September 2020

Track guidance whiffed when the Hurricane Warning was put up

Resulted in a clear-sky bust for Louisiana

Note HMNI closest - yet it had a NE bias for Marco. Recent past does affect forecaster perceptions

Track/Warning Forecast Challenges - Sally

ECMWF Ens 0600 UTC 13 September 2020

No help from the best ensemble system either

If anything you might suspect the forecast would bust left, not right

Some stronger members on right side, but intensity skill lags

Genesis Guidance

Little objective guidance is seen with ensembles now, though they help subjectively.

In-house product

shading: combined probability of 70 ensemble members (GEFS + ECENS):

- 850 – 700 hPa RH > 70%
- 200 – 850 hPa vertical wind shear < 20 kt

contours: 850 hPa relative vorticity ($8 \times 10^{-5} \text{ s}^{-1}$ intervals)

thin green: ECENS members

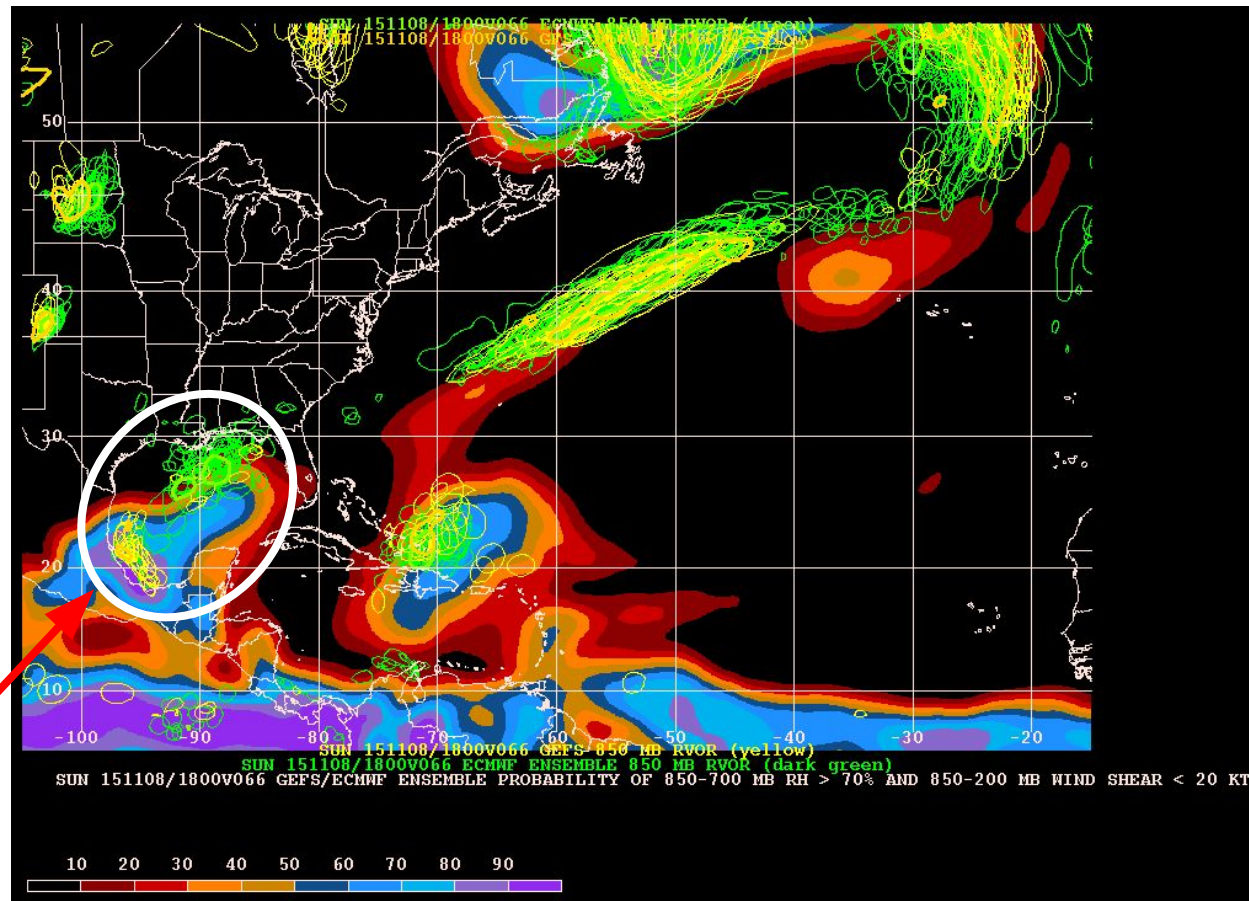

thick green: ECMWF deterministic

thin yellow: GEFS members

thick yellow: GFS deterministic

Invest AL93

0000 UTC November 6, 2015 + 66 h

Learning Objectives

- Explain the value of ensembles
- Explain how NHC incorporates ensembles into their forecast products
- Correctly interpret the uncertainty NHC forecast products
- Evaluate ensemble guidance to estimate the uncertainty in TC track or intensity forecasts

How did we manage to extend the FSH beyond 2 weeks?

Predictable signals propagate from the better-initialized and more predictable scales ('mainly' the large scales, the slowly evolving components) to the less predictable (small/fast) scales

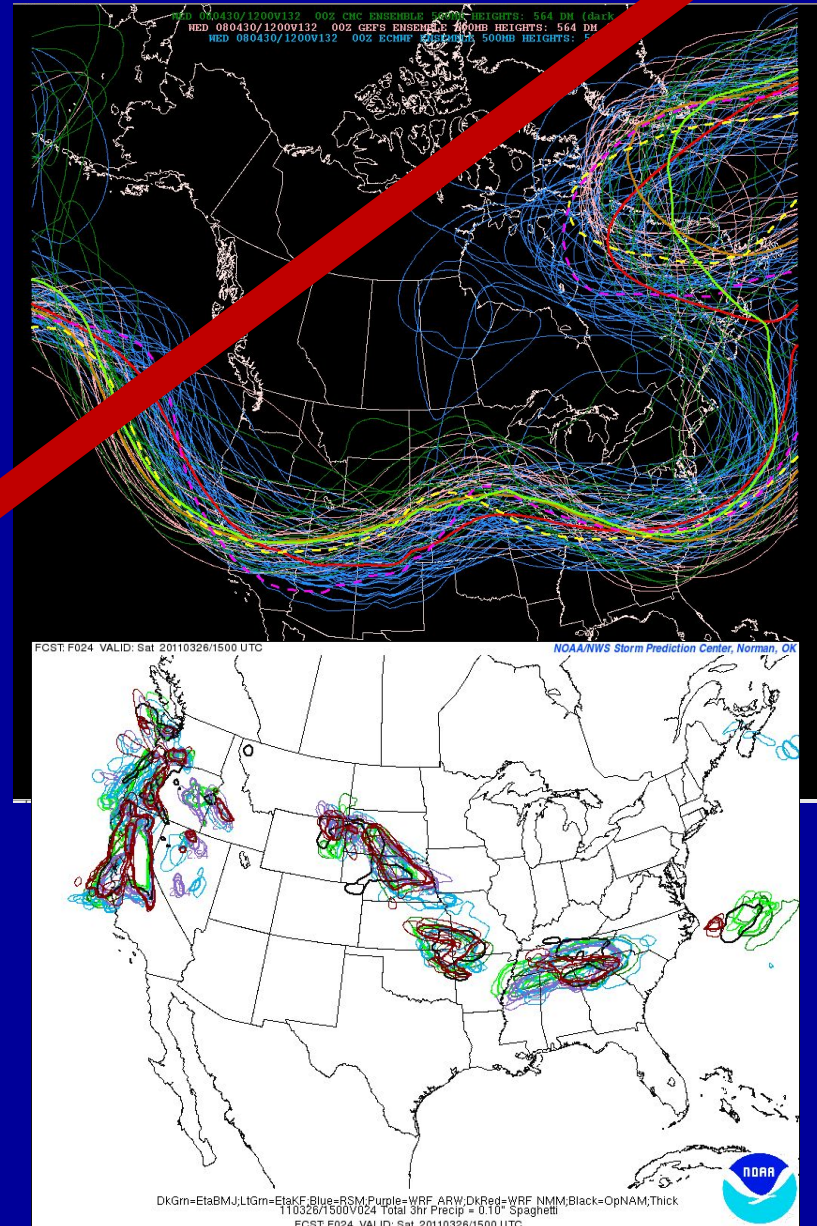

Errors propagate from poorly initialized scales ('mainly' the smaller scales) thus reducing the predictive skill

(Buizza and Leutbecher 2015, QJRMS)

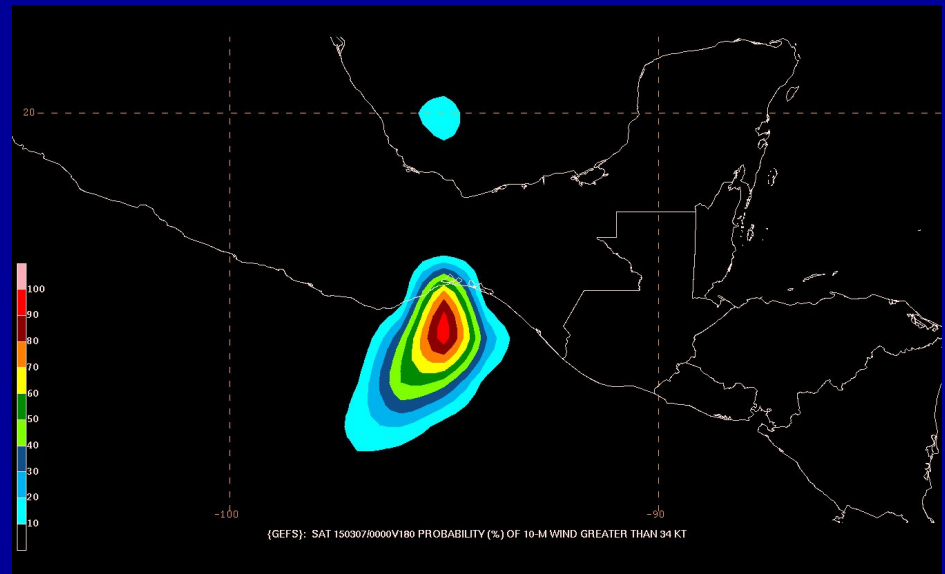

Ensemble Use

- Originally used for medium- to long-range forecasting of the large-scale pattern
- Uses have grown to encompass all temporal and spatial scales down to convective storm scale
- Address uncertainty particularly those leading to rapidly diverging solutions
 - Initial conditions, model physics, resolution, model numerics

Ensemble Use

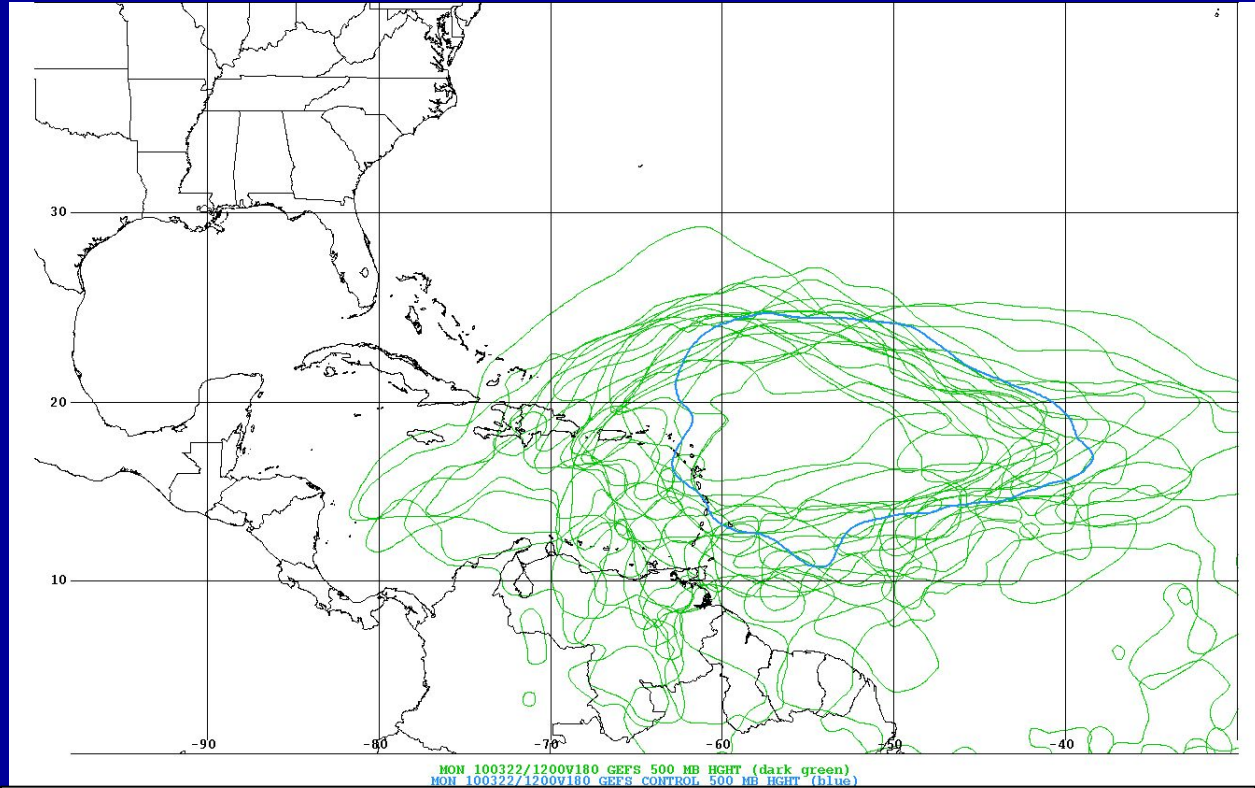

- Estimate rate of skill loss with time
 - Spread of solutions generally increases with time
- Compute probabilities for a particular event or condition
 - 25 mm of precipitation, winds > 34 kt
- Identify regions where the analysis and forecast are sensitive to additional data in the analysis
 - Ensemble Kalman Filter, targeted observations (next week Ryan Torn's talk)

Current Global Ensemble Systems that NHC uses most frequently

NCEP Global Ensemble Forecast System (GEFS)

- 4 cycles per day (00, 06, 12, 18 UTC)
- 31 members (1 control + 30 perturbed)
- Forecast extends out to 384 hours (16 days)

180-h forecast of 588 dm 500-mb height contour valid at 1200 UTC 22 March 2010

NCEP GEFS

- Current Configuration (last upgrade Sep 2020)
 - ~25 km resolution, run to 35 days at 00Z
 - 64 vertical levels
- Ensemble members
 - 30 members generated using EnKF
 - Uses stochastically perturbed physics tendencies (SPPT) scheme and stochastic kinetic energy backscatter (SKEB) scheme for perturbations
 - Model physics consistent with GFS
- Deterministic GFS (2024 upgrade coming?)
 - ~13 km resolution for full run (16 days)
 - 127 vertical levels

Maybe shorten and summarize GEFS/ ECMWF including #members and resolution. No Kalman Filters

Joaquin ensemble guidance

Case Example

Plume Diagrams

NCEP Short Range Ensemble Forecast System (SREF) plume diagram for total precipitation at Durango, Colorado, starting at 15Z 27 Feb 2015 (courtesy NWS SPC)

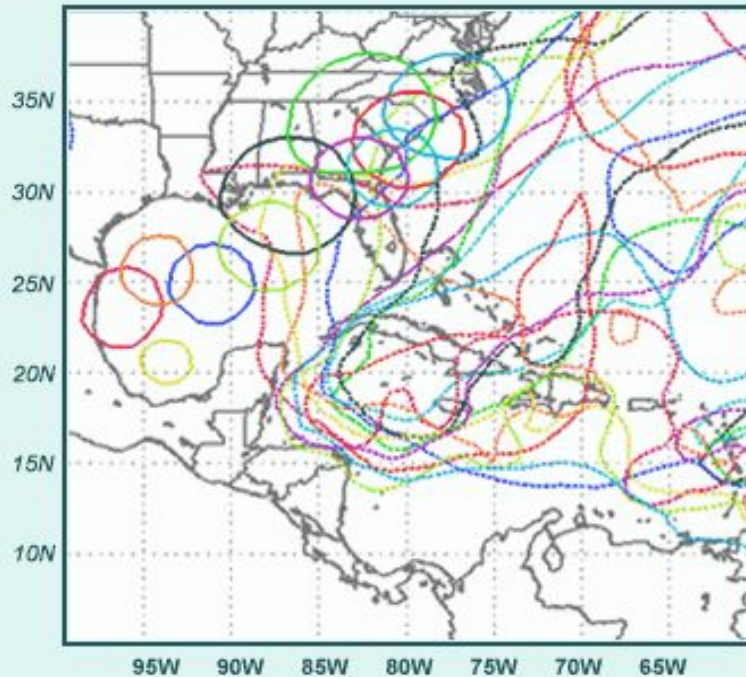

Ensemble Forecast Example

- Initial time: 1200 UTC 11 Sep 2004
NCEP Ensemble members  and operational GFS 
- Purple dots = forecast position at 0300 UTC 17 Sep 2004 (FHR135)
- Ensemble forecast shows large uncertainty in ultimate path of Hurricane Ivan
- Tendency for clustering of tracks
 - 5 members east of the GFS track and faster than GFS at 0300 UTC 17 Sep 2004
 - 4 members west of GFS
 - Operational GFS and 1 member in the middle of the ensemble solutions

Ensemble Forecast Example

500 hPa Height and Sea Level Pressure Forecast from
1200 UTC 11 Sep 2004 Ensemble Run Valid 0000 UTC 16 Sep 2004

NCEP Data / The COMET Program

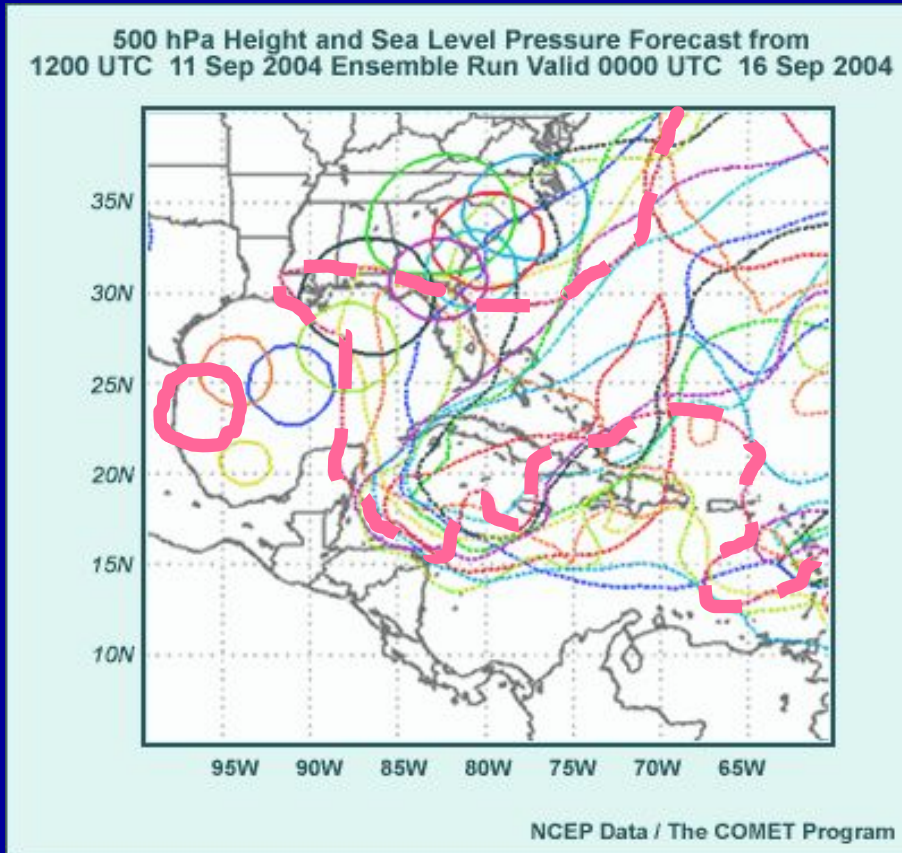

- **Forecast: 0000 UTC 16 Sept 2004
108-hour NCEP ensemble forecast**
- **500-mb 589-dm height (dashed) and
1000-mb PMSL (solid), color coded by
ensemble member**
- **Degree of weakening of western
Atlantic ridge over the northeast Gulf
of Mexico determines position of
Hurricane Ivan**
 - Ridge strongest in pink: Ivan near
northeastern Mexico, 589-dm height
contour in mid-Gulf
 - Ridge weakest in light blue: Ivan over
the Georgia coast, 589-dm height
contour over the western
Atlantic/northwest Caribbean

Question 2

In which situation(s) is a well-calibrated ensemble system likely to fail?

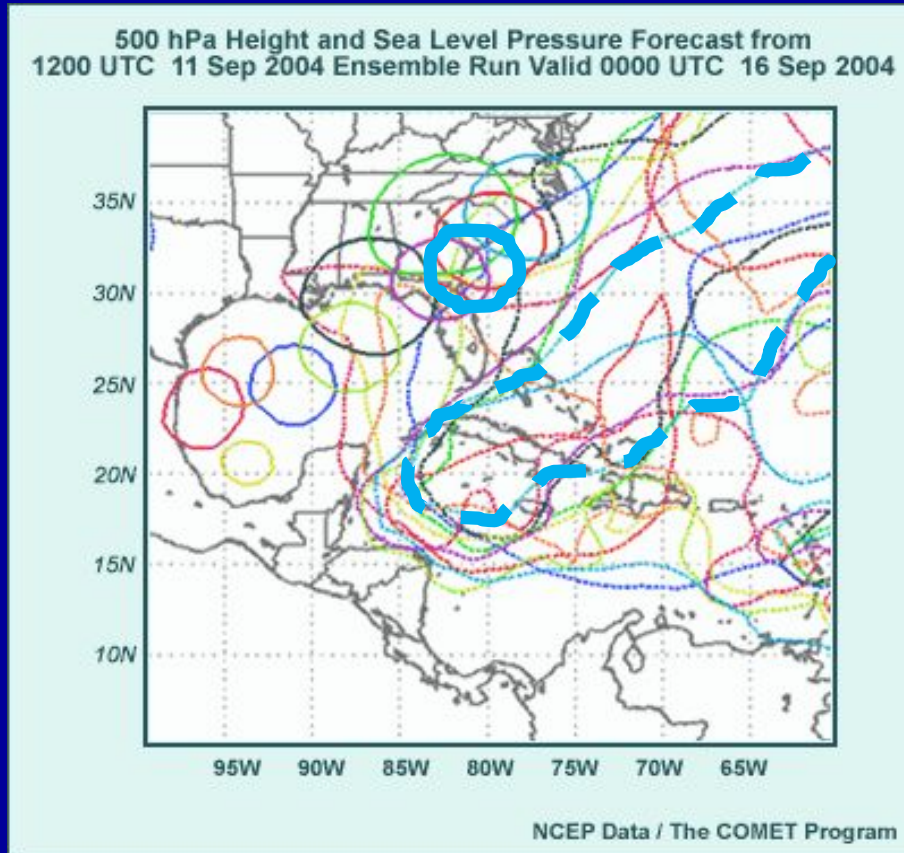

- A. Unusual forecast track cases
- B. When TC track is dependent on intensity
- C. If deterministic models are in poor agreement
- D. All of the above
- E. B & C

Ensemble Forecast Example

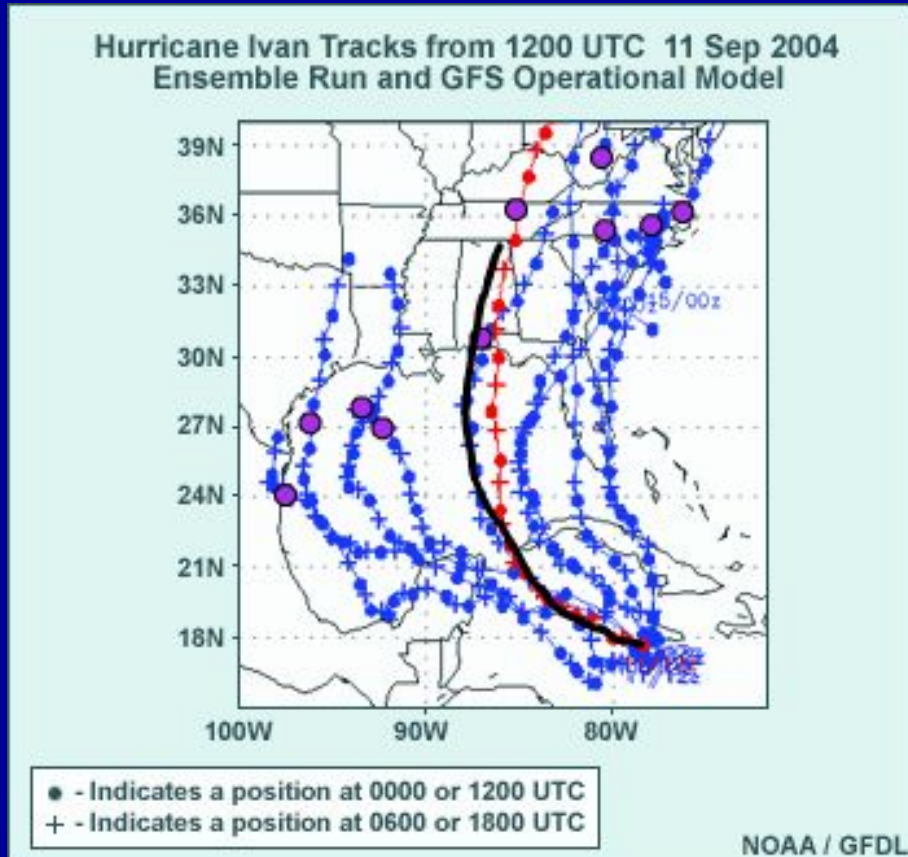

- Forecast: 0000 UTC 16 Sept 2004
108-hour NCEP ensemble forecast
- 500-mb 589-dm height (dashed) and
1000-mb PMSL (solid), color coded by
ensemble member
- Degree of weakening of western
Atlantic ridge over the northeast Gulf
of Mexico determines position of
Hurricane Ivan
 - Ridge strongest in pink: Ivan near
northeastern Mexico, 589-dm height
contour in mid-Gulf
 - Ridge weakest in light blue: Ivan over
the Georgia coast, 589-dm height
contour over the western
Atlantic/northwest Caribbean

Ensemble Forecast Example

- **Forecast: 0000 UTC 16 Sept 2004
108-hour NCEP ensemble forecast**
- **500-mb 589-dm height (dashed) and
1000-mb PMSL (solid), color coded by
ensemble member**
- **Degree of weakening of western
Atlantic ridge over the northeast Gulf
of Mexico determines position of
Hurricane Ivan**
 - **Ridge strongest in pink: Ivan near
northeastern Mexico, 589-dm height
contour in mid-Gulf**
 - **Ridge weakest in light blue: Ivan over
the Georgia coast, 589-dm height
contour over the western
Atlantic/northwest Caribbean**

Ensemble Forecast Example

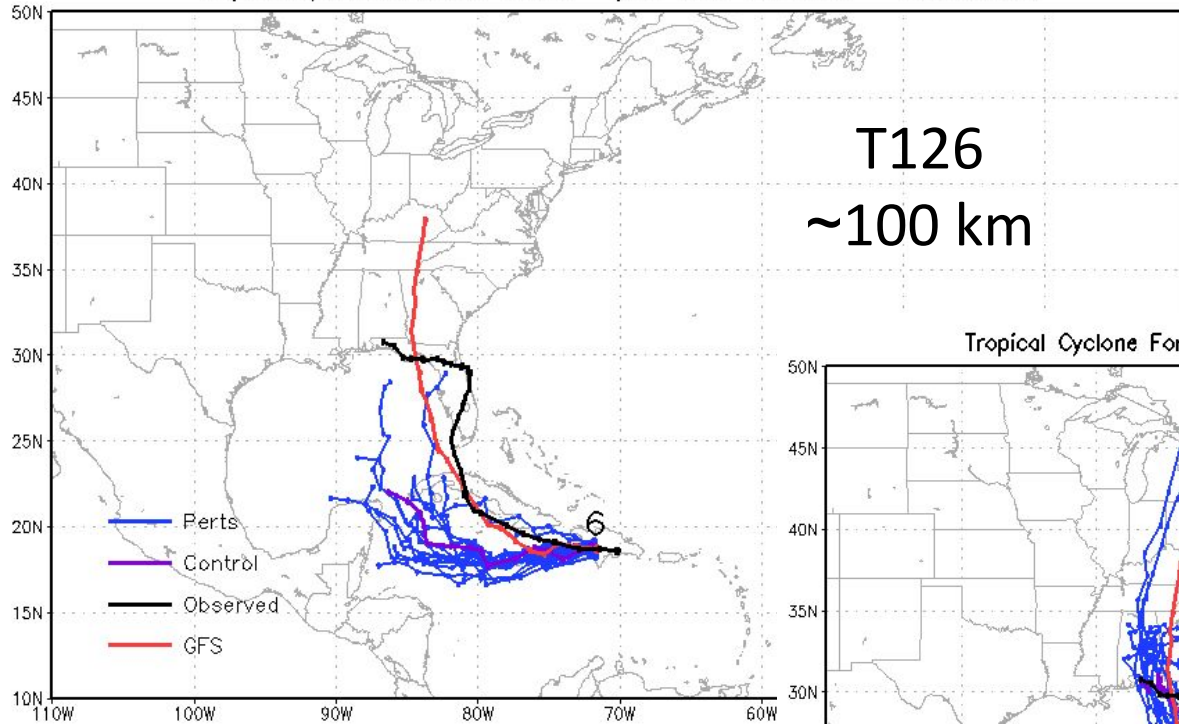

- Ultimate path for Hurricane Ivan (black) - not too far from GFS and in the middle of the ensemble envelope of solutions
 - Wide envelope of possible tracks
 - Because of uncertainty in the weakening of the Atlantic ridge, it turned out to be the best solution
 - Typically, one would be wary of using the ensemble mean forecast when there is clustering of the solutions
 - Look at the handling of the ridge by the other dynamical models to determine which “cluster” to lean toward

Improvements to Global Ensemble TC Track with Increasing Horizontal Resolution

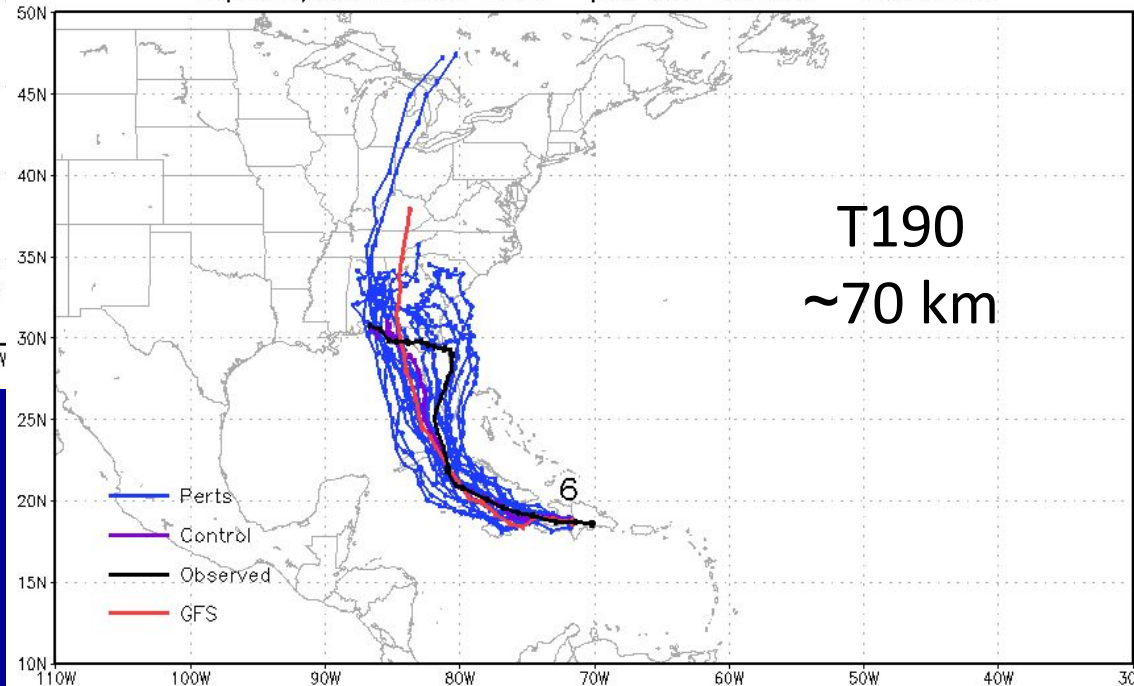

Tropical Storm Fay 00Z – 16 Aug 2008

Tropical Cyclone Forecast Tracks – prod NCEP Ensemble – 2008081600

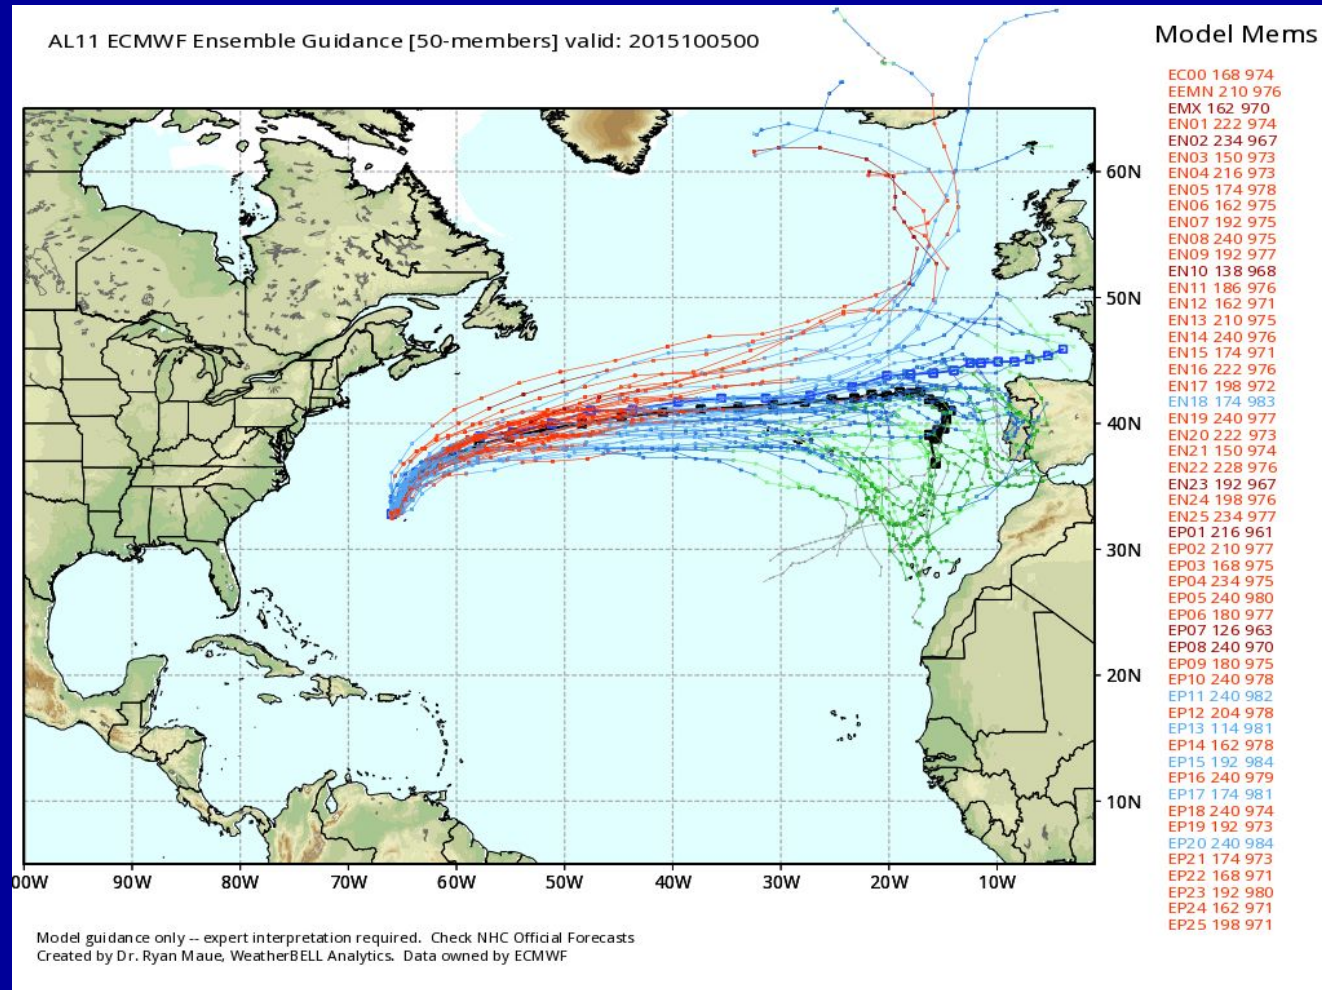

More members retain the TC
and track forecasts are much
improved

 - **Blue** – good agreement between members

Intensity Change Probability Distributions

Poll Question 1

What are some current advantages of using single-model ensembles?

- A. Estimates of uncertainty
- B. TC intensity model spread
- C. Alternative TC-track solutions
- D. The correct track will always be within the spread

ECMWF Ensemble Prediction System

- 51 members (1 control+50 perturbed members)
- Run twice daily (00 and 12 UTC) out to 15 days, 6/18 UTC 144h
 - T639 (~ 18 km) to 15 days
 - 137 vertical levels

Perturbations:

- Generated using singular vectors and stochastically Perturbed Parameterization Tendencies Scheme (SPPT)

Deterministic ECMWF

- Horizontal grid resolution T1279 (~9 km) out to 10 days with 137 vertical levels

Big ensemble upgrade coming in June for horizontal resolution to match deterministic!

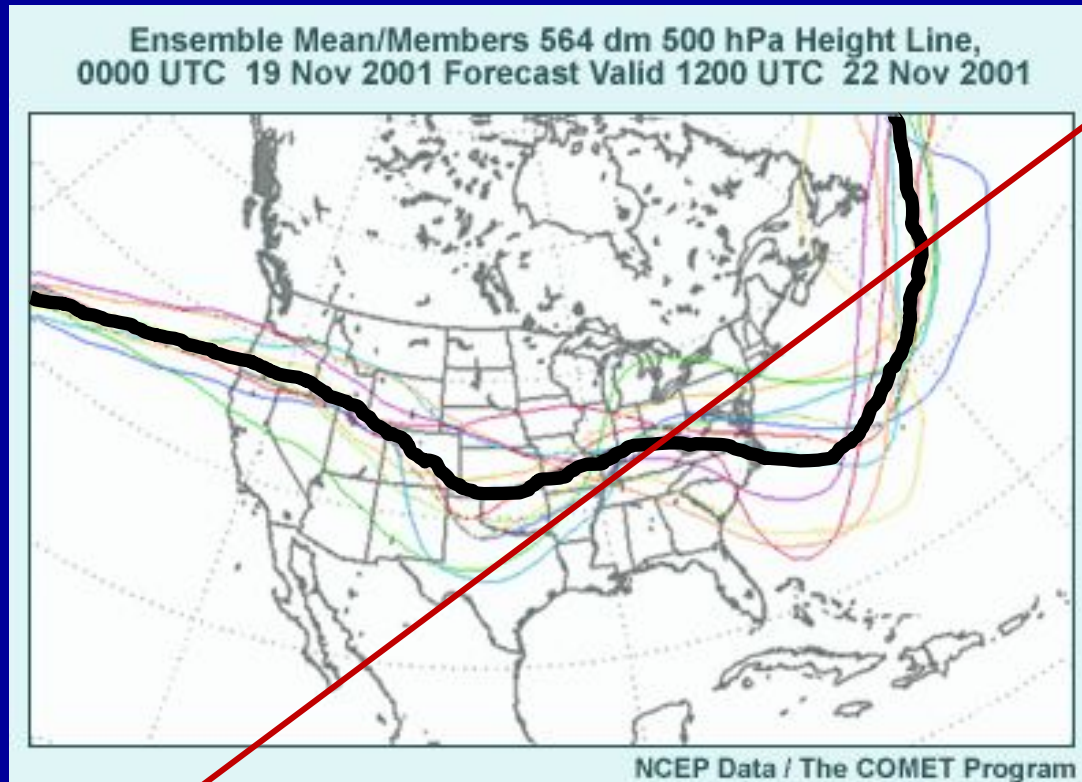

Ensemble Display and Interpretation

Displaying Ensembles

If we try to look at every ensemble member at once, it is messy and difficult to interpret

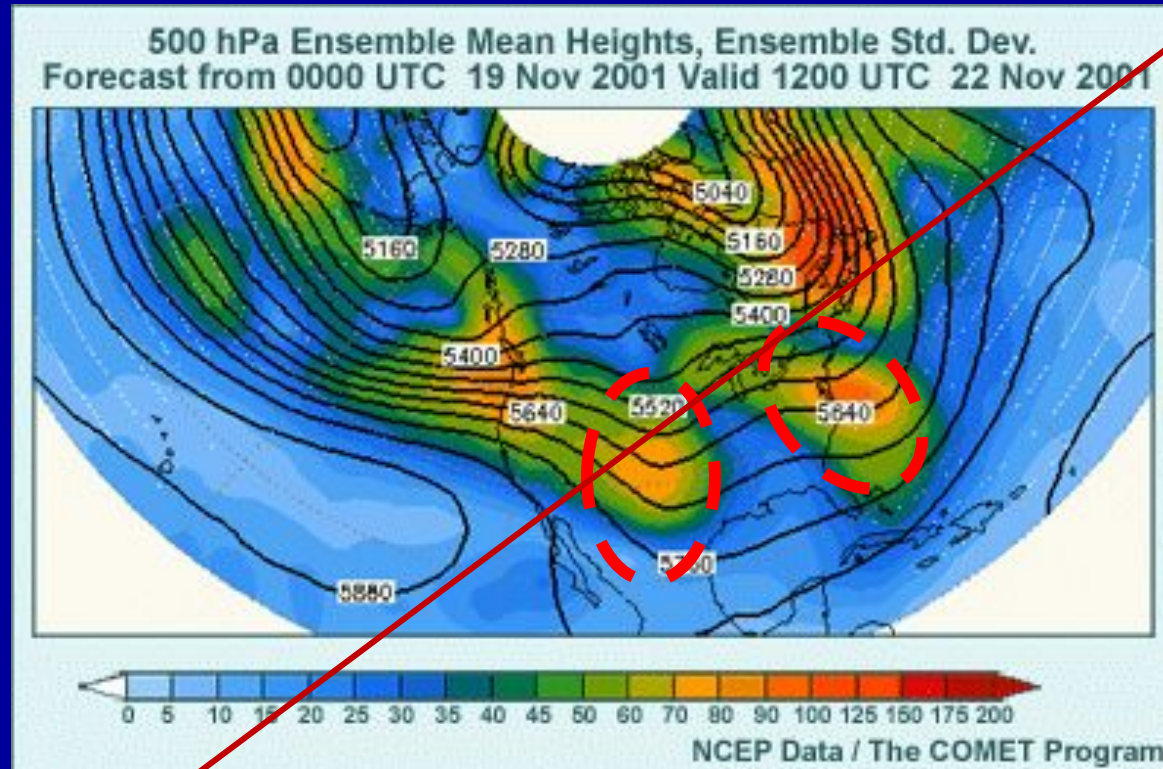

Displaying Ensembles

Ensemble Mean - average of multiple forecast members verifying at same time

Displaying Ensembles

Ensemble Mean and Spread

- **Black lines** = ensemble mean 500-mb height forecast
- Spread indicated by shading (meters)
 - **Orange/Red** – little agreement between members
 - **Blue** – good agreement between members

Displaying Ensembles

Ensemble Mean and Spread

- Advantages
 - Summarizes data in easy to interpret form
 - Information provided for the entire domain
 - Low predictability features smoothed out by the ensemble mean and easily identifiable using spread
- Disadvantages
 - Ensemble mean can be misleading (and may not be the best forecast) if multiple clusters of nearly equal probability forecast outcomes exist (i.e., bi-modal distribution)
 - May not reveal extreme outlier solutions

Interpreting Mean and Spread

Large spread within the ensemble mean feature □ **Uncertainty in amplitude of the feature**

• In this case, there is uncertainty in the **depth** (not the location) of this 500-mb trough

• If there were a tropical cyclone located southeast of this trough, would the trough be deep enough to recurve the tropical cyclone?

Interpreting Mean and Spread

Large spread upstream or downstream of an ensemble mean feature □ **Uncertainty in the location of the feature**

- In this case, there are nearly equal chances that the 500-mb trough will be east or west of the position shown by the ensemble mean trough

- If a tropical cyclone was located southeast of this trough, at what time will the tropical cyclone begin to be influenced by this trough?

Interpreting Mean and Spread

Large spread on one side of an ensemble mean feature □ **A cluster of ensemble members different from the ensemble mean**

- In this case, the spread indicates greater potential for the trough axis to be east of the ensemble mean trough than to the west

- If there was a tropical cyclone located southeast of this trough, at what time will the tropical cyclone begin to be influenced by this trough?

Learning Objectives

- Explain the value of ensembles
- Explain how NHC incorporates ensembles into their forecast products
- Correctly interpret the uncertainty NHC forecast products
- Evaluate ensemble guidance to estimate the uncertainty in TC track or intensity forecasts

How did we manage to extend the FSH beyond 2 weeks?

Predictable signals propagate from the better-initialized and more predictable scales ('mainly' the large scales, the slowly evolving components) to the less predictable (small/fast) scales

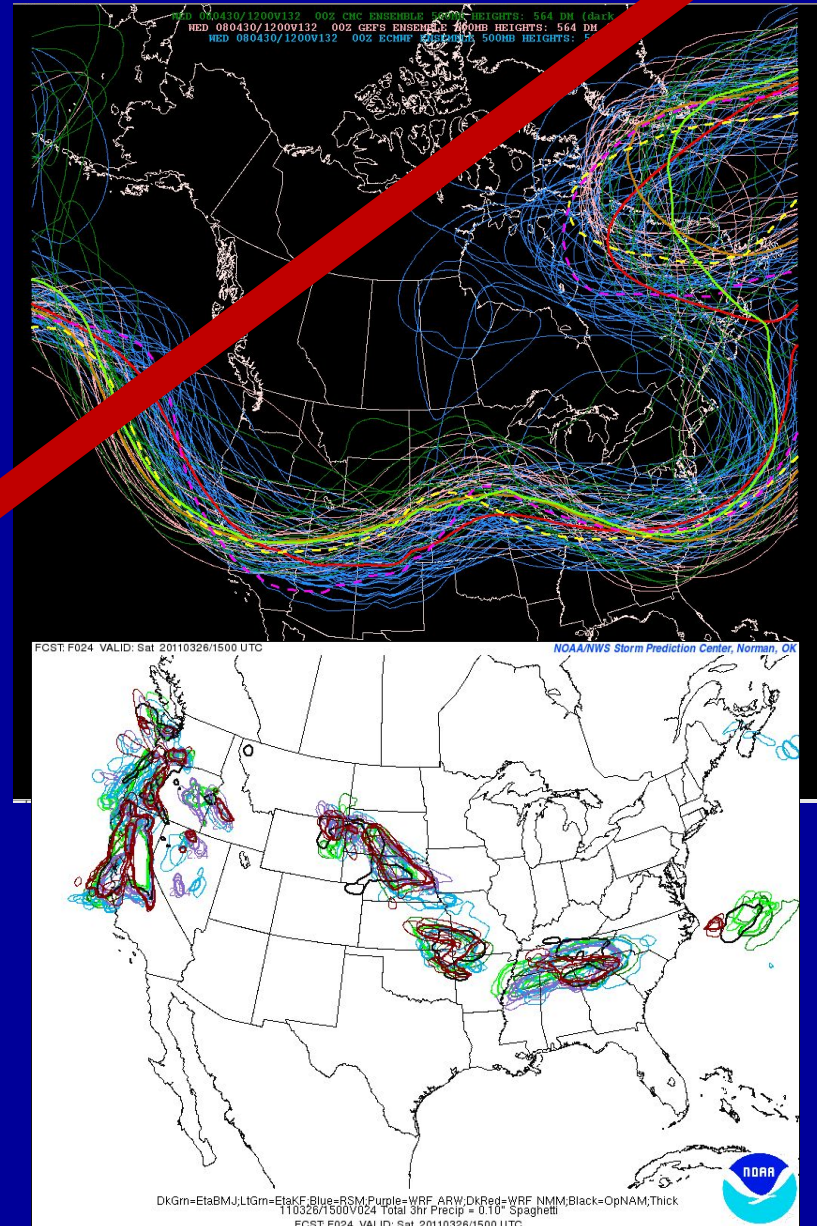

Errors propagate from poorly initialized scales ('mainly' the smaller scales) thus reducing the predictive skill

(Buizza and Leutbecher 2015, QJRMS)

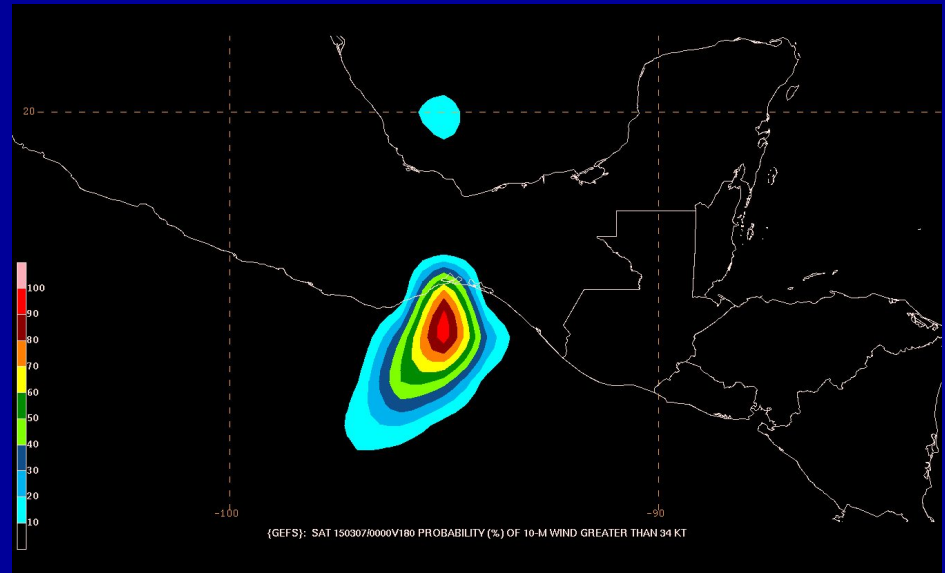

Ensemble Use

- Originally used for medium- to long-range forecasting of the large-scale pattern
- Uses have grown to encompass all temporal and spatial scales down to convective storm scale
- Address uncertainty particularly those leading to rapidly diverging solutions
 - Initial conditions, model physics, resolution, model numerics

Ensemble Use

- Estimate rate of skill loss with time
 - Spread of solutions generally increases with time
- Compute probabilities for a particular event or condition
 - 25 mm of precipitation, winds > 34 kt
- Identify regions where the analysis and forecast are sensitive to additional data in the analysis
 - Ensemble Kalman Filter, targeted observations (next week Ryan Torn's talk)

Current Global Ensemble Systems that NHC uses most frequently

NCEP Global Ensemble Forecast System (GEFS)

- 4 cycles per day (00, 06, 12, 18 UTC)
- 31 members (1 control + 30 perturbed)
- Forecast extends out to 384 hours (16 days)

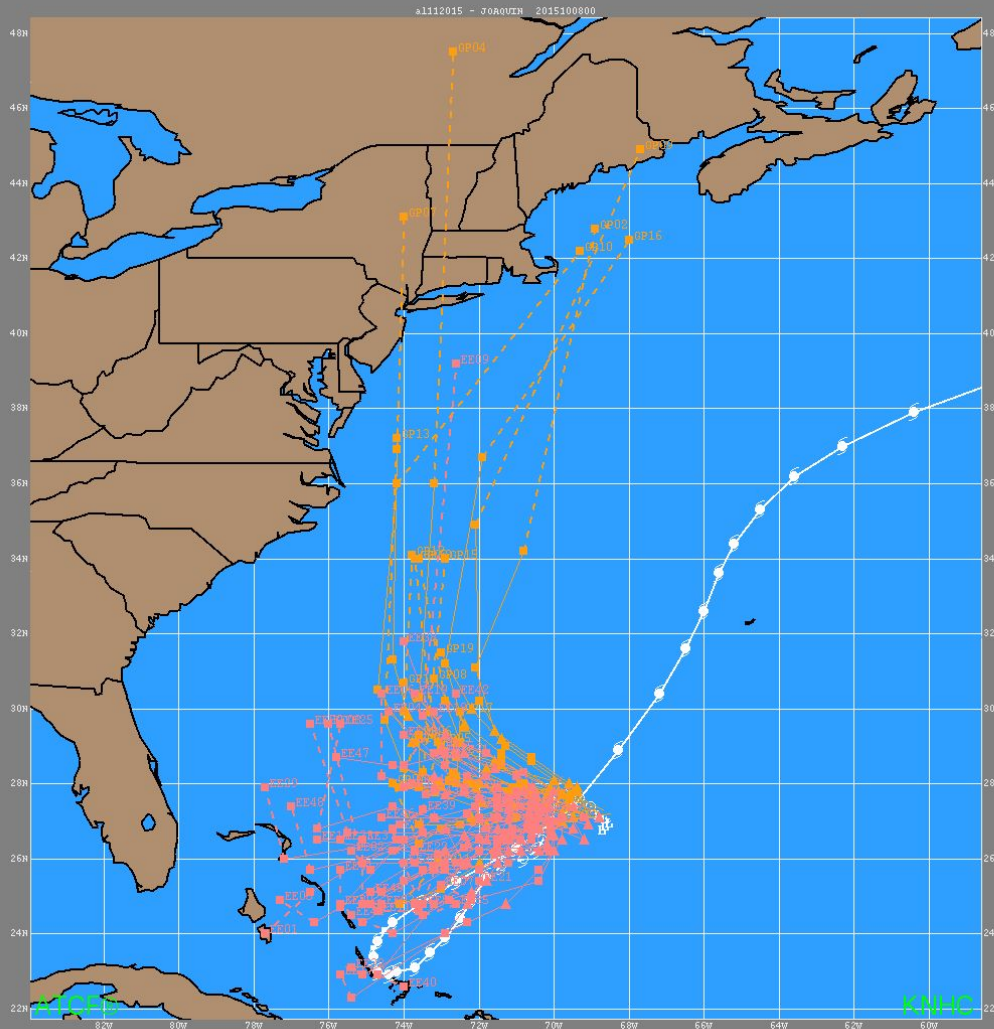

180-h forecast of 588 dm 500-mb height contour valid at 1200
UTC 22 March 2010

NCEP GEFS

- Current Configuration (last upgrade Sep 2020)
 - ~25 km resolution, run to 35 days at 00Z
 - 64 vertical levels
- Ensemble members
 - 30 members generated using EnKF
 - Uses stochastically perturbed physics tendencies (SPPT) scheme and stochastic kinetic energy backscatter (SKEB) scheme for perturbations
 - Model physics consistent with GFS
- Deterministic GFS (2024 upgrade coming?)
 - ~13 km resolution for full run (16 days)
 - 127 vertical levels

Maybe shorten and summarize GEFS/ ECMWF including #members and resolution. No Kalman Filters

Joaquin ensemble guidance

GEFS
